06 Aug: 1219 1223 1227 B2.2 SF 7762 N05E27 Continuum

NOTES:
All times are in Universal Time (UT). Characters preceding begin, max,
and end times are defined as: B = Before, U = Uncertain, A = After.
All times associated with x-ray flares (ex. flares which produce
associated x-ray bursts) refer to the begin, max, and end times of the
x-rays. Flares which are not associated with x-ray signatures use the
optical observations to determine the begin, max, and end times.

Acronyms used to identify sweeps and optical phenomena include:

II = Type II Sweep Frequency Event
III = Type III Sweep
IV = Type IV Sweep
V = Type V Sweep
Continuum = Continuum Radio Event
Loop = Loop Prominence System,
Spray = Limb Spray,
Surge = Bright Limb Surge,

EPL = Eruptive Prominence on the Limb.

Bruce James Robert Linley (linley@netcom.com) wrote:
: Would it be possible for me to talk to my dad through a local 2m
: repeater (he could receive me on a scanner), and my dad to communicate
: back on the CB? Is either communication considered a "one-way" trans-
: mission? I've already talked to the 2m repeater owner and he has no
: objections to this particular use of his repeater. Any Part97/Part95
: prohibitions to cross-service QSOs? Thanks.

OK, I think the answer to this is no. Check part 97.111b for one-way
transmission qualifications. Your instance does not qualify for any of
the conditions.

Check Part 97.113b:
"An amateur station shall not engate in any form of broadcasting. . .
except that communications directly related to the immediate safety of
human life or the protection of property may be provided. . ."
As I understand it, transmitting for any non-ham to hear is broadcasting.

My 2 cents.

2154. WANTED: IC-290-A mic

Newsgroup: rec.radio.amateur.misc
Date: 1994-08-08 05:44:28 UTC
From: benacp@netcom.com
Message-ID: <benacpCu7By4.Lst@netcom.com>
Source record: 262104

Howdy all,

I have an old IC-290-A 2m All-mode. I need a touch-tone mic for it
I know it was at east an HM-1, but I can't remember if it had a letter after
the one or not. Icom has seen fit to obsolete the mic and the current 8 pin
mic does not work with the IC-290-A.

I know there were several assessories that were made for it and if they
are available somewhere I'll consider them as well.

I have an IC2AT and a IC-551-D that I am looking for working parts
and assessories for as well.

I haven't been active for 5 years, but all my equipment stills works
I just want to make sure they continue to do so. To that end if anyone has
any service manuals (except the 2AT's) they'd be willing to part with I will
purchase them as well.

The most important thing is the mic for the IC-290-A. Please e-mail
me at benacp@netcom.com or via Compuserve at 74151,2703.

73's and thanks in advance
Pete N2BLY.

PS I don't believe I'll be leaving this hobby again.

Oh yes, while I got your attention. Please add the IC-4AT to the list
of the impossible I want. I don't really care if the 4AT works, but of course
I won't pay as much for it :)

Anyone has the manual for the IC-4AT that would be a real help too.

73's
Pete N2BLY

DIV. PRESIDENT'S ADDRESS

This is Michael Corbin VK2PFQ.

Firstly,I must apologise that my address this week will be quite lengthy. I had hoped to bring you some better news this week on our progress with the " on going saga" or " the never ending story", whichever you prefer, but it was a question of, once again, the intervention of "Murphy," or... was it someone else....

You'll recall last week that I had said that there would be a "Council" meeting on Thursday at which the opinion of the Barrister would be discussed and a decision made as to "where to go from here." Well it seems that there were people who had other ideas on this matter. I'll present you with the facts and let you decide for yourselves. It appears that our Secretary, Mr. Roger Harrison was not going to be in Sydney on the appointed day - Thursday 4th August 1994. Further, it appears that when the notice of the meeting was received by his office staff they did not advise him, nor have they yet, that there was to be a meeting on Thursday 4th August..... or did they? But, let's not jump to conclusions. ... ... some more facts.

On 2nd August at 22.32 hours a packet message was "put up" by the propaganda machine of the now defunct "A" team. It contained information that...A Council meeting was set down for Thursday 4th August, despite the known-in-advance fact that Roger Harrison would be Interstate and unable to attend. I have not quoted this verbatim. However some questions spring to mind.

(a) Known by whom Sir. Certainly not by me, and it seems, not by anyone else, at least, NOT for the time being. Indeed, I have still not received an apology from Mr. Harrison for his non attendance, or his refusal to officially call the meeting or even attempt to CANCEL it for that matter.... Perhaps this is one of those times when it suits our Secretary not to recognise us as a "Council" (in inverted commas) or me as a " President" (also with the appropriate Punctuation). Ask any Councillor how often the Secretary insists that we ARE a Council and that we SHOULD get on with the job. However, on this occasion, he chose not to recognise me as the President, or my right as the "elected" leader of the "group" to call a meeting for what can only be described as.... a very important purpose. Makes you wonder doesn't it.

There is another strange thing about all this and that is that the Secretary also chose to ring at least one Councillor and inform him that he, the Secretary, was Interstate and could not possibly attend the meeting on the Thursday night. Could this mean his Office told him after all....one wonders!

I ask several questions. If the Secretary had time to ring one Councillor why didn't he find the time to ring me? Is, or was, finance a problem? I would surely have accepted a reverse charge call. He could have even used the 1-800 toll free line between 10 am and 2.00 pm. He could have left a message on the Institute answering machine..... even the Director of the "A" team propaganda machine could have advised me instead of scoring feeble points with vexatious Packet messages.....the possibilities are endless... Let me say it again. "I am still waiting for Official notification from the Secretary that.... (a) He would not be able to attend a meeting of Council, as he would still be in Melbourne on that day..... (b) Would it be possible to defer this meeting to the next day?. (that would have been OK if he had asked) and (c) What other matter or matters did I wish to have included in the meeting agenda ....If he argues that he did none of the above as he did not receive my notice until he returned home after the scheduled time of the meeting .... well.... that would be fine But, it's now Sunday and I still have not received any contact from the Secretary Roger Harrison. It makes you wonder doesn't it. It makes you wonder whether he has some other hidden agenda doesn't it.... Hmmmmmmmmm! What is most distressing to me and must be to you, the members, is that it makes a COMPLETE JOKE of the resolution passed at a Council meeting which stated that "the matter should be resolved quickly and as cheaply as possible."

Some critism has been leveled at me because of the way I wrote to the Councillors and advised them of the intended meeting. I'll read it to you and you make up your own mind.

NOTICE OF MEETING

A meeting of the "Council" of the Wireless Institute of Australia New South Wales Division will be held next Thursday 4th August 1994 at 7.30 P.M. at Amateur Radio House Parramatta.

An agenda will be issued on the night. The prime purpose for this meeting is to discuss the included material from the Divisional Solicitor Messrs. Lewarne & Goldsmith of Parramatta.

To obviate the need for you to search around for your copy of the Articles I have included an up-to-date copy for your information.

See you there.

Michael B. Corbin

Now the criticism were... (a) It was not dated. (b) it was not called by the Secretary under Section 69(d) of the M & A's and

(c) It was not signed even though it had Michael B. Corbin on the bottom and was on an Institute Letterhead... Who do they think sent it? The bloody tooth fairy?

I inform you of these things so that you can be aware of the sort of rubbish the "Council" is forced to put up with. All I want to do is get on with it. I am not interested in teams, not interested in past events. All I want is a resolution to the problem. You the members have been especially tolerant to date. There is a light at the end of the tunnel, which leads me to what was stated in the letter from the Divisional Barrister.

As I told you last week the proposition of an Administrator was investigated and discounted for the reason that we were not insolvent nor were we in danger of becoming insolvent. The Barrister has suggested that we make an application to the Federal Court of Australia for an order that a General Meeting of the Division take place. Further, to seek directions in relation to the conduct of that meeting on the basis that it is impracticable to call a meeting by the normal procedures. The Court has the power to do this in Section 251 (1) & (2) of Corporations Law.

"251 (1) Meeting convened and conducted as the Court thinks fit

If for any reason it is impracticable to convene a meeting in any manner in which meetings may be convened or to conduct the meeting in the manner prescribed by the articles or this Law, the Court may, either of its own motion or on the application of any director or of any member who would be entitled to vote at the meeting, order a meeting to be convened, held and conducted in such manner as the Court thinks fit, and may give such ancillary or consequential directions as it thinks expedient, including a direction that 1 member present in person or by proxy shall be deemed to constitute a meeting.

(2) Such meeting deemed duly convened

Any meeting convened, held and conducted in accordance with any order made pursuant to this section, shall, for all purposes, be deemed to be a meeting duly convened, held and conducted."

Further Section 1319 of the Corporations Law provides:

"Where, under this Law, the Court orders a meeting to be convened, the Court may subject to this Law, give such directions with respect to the convening, holding or conduct, of the meeting, and such ancillary or consequential directions in relation to the meeting as it thinks fit."

The objective of this meeting would be to place a group of resolutions before the meeting which would

(i) Provide for a fresh election for all Council positions. (that's pretty straight forward)

(ii) Resolve that the newly elected Council NOT be required to retire until the Annual General Meeting in 1996. The effects of this are obvious .... should this matter successfully get to Court without any opposition, it would probably be heard by the Court around November sometime. Now it seems silly to hold an election then, that is in November/December which would give the Council a term in Office of ONLY 5 months. In simple terms, what the Barrister is suggesting is... hold an election after approval to do so is obtained from the Court. Then .... don't have another election until April 1996, giving the new Council a term of 17 months instead of the usual 12 months.... now that's not a bad idea is it? It is certainly cheaper to hold ONE Election than it is to hold two.

(iii) Ratify the acts done in the name of the Council or Division since the election in April, 1994. This would regularise the conduct of the Business of the Division from April 1994 to date.

Now before anyone jumps to conclusions, particularly the propaganda machine, members are reminded that at a meeting between the unsuccessful candidates, the "Council" and the Concerned Amateur Group, it was decided that since the business of the Division had to proceed, that is, things like wages, electricity, rates, stationery had to be paid for, then "the Council" in inverted commas would be empowered to pay these accounts. An undertaking was given that there would be no expenditure other than this. If any unforeseen matters arose then monies could not be spent without the approval of this group. So that this could be proved a balance sheet would be produced for this meeting showing every item of expenditure . ... and don't worry, I have not forgotten that another Balance Sheet has yet to be produced as was moved at the last AGM. It's a case of not having the time as yet. It WILL be produced as promised.

(iv) Establish who is to be the Returning Officer for the next election of the Division and what precisely are the functions and powers of the Returning Officer. I think this is self explanatory.

(v) Establish the methods which will be employed in the conduction of this election ie. Length of curriculum Vitae. Access to mailing lists. How to Vote information and so on. Along with others I have definite views on this subject.

Obviously articles 47,48,50,31 and 72 need to be amended to accommodate the aforementioned objectives. I will set these out in detail for you next week so that you might be a part of the process.

I believe that the summary in the Barristers letter is worthy of note. All Armchair Strategists, Hand Sitters and Chin Strokers Please Note and I quote

"It may well be that there are other articles and matters which require attention in order to achieve the desired purpose. My

instructing Solicitors and any member of the Division qualified whether by experience, a working knowledge of the constitutional documents of the Division or otherwise may well have valuable contributions to make to the process of pinpointing the amendments to the Articles of Association and the resolutions necessary to bring the proposal to fruition.

I repeat and emphasise that, as lawyers, we can offer no political solutions. These must be achieved within the Division. The new election is proposed as a cheap and expedient alternative to lengthy and expensive litigation." End of quote

Well there you have it members. It might not be what we all wanted but it's a solution and a solution at .... and I'll quote again Council Resolution ...." the cheapest possible cost". I would appreciate any feedback on this proposal particularly from the 551 who, in the "Straw Poll," indicated that they were happy with things as they were, all things considered. I need to know whether this proposal is acceptable. Think about it for a week and let's hear from you either during the week or on callbacks this week or next week. Do you support it or don't you. A simple YES if you do will suffice.

I am available during the week on (02) 626 9288 or via my fax (02) 626 6066. To make this work we need a majority decision.

As my address this week has been quite lengthy, I will leave the finer details regarding the actual wording of the amendments until next week. Finally, I have received a disturbing letter from Mr. Peter Gibson VK3AZL Acting Chairman Publications Committee (They are the Committee responsible for the Publication of AR Magazine), regarding an address by Mr. Roger Harrison representing Federal Council. My inquiries in this matter are, as yet incomplete.

More on this next week.

See you then.

NTAC Report

Greeting from VK2XB/VK2WAG your friendly NTAC liaison officer with some news of the progress of this vital part of Divisional affairs.

As I am sure you are all aware, the NSW Division has been embroiled in somewhat of a political dilemma. This has had a major adverse effect on NTAC's ability to function because we have been unable to initiate any of the much needed activity as is required because we have only been doing the bare necessities. It has alo meant that funds have not been able to be spent on much needed items. An example of this is that NTAC needs a full complement of maps of the state, preferably in 1:100 000. As this "Council" has been operating in a caretaker capacity, it is hard to judge whether or not some people may misconstrue the spending of several hundreds of dollars

on maps as outside our charter. I know such restrictions also apply to other Divisional activities, but in NTAC's case, the burden is far greater than it should be because of the fact that basically it was in an absolute mess. I certainly do not wish to accuse anybody of creating this disaster, however I believe that it has been something that has been allowed to occur over a considerable period of time. Barry Sullivan, the NTAC Chairperson (to satisfy those who require politically correct terminology) has done a marvellous job in obtaining data bases, path loss predicting programs and a myriad of other tools to assist in these processes. Without these, nothing could have been done.

Basically, we had absolutely none of the information and tools required to do just about anything.

At this point in time we still have no maps. What do we need maps for you might ask? Well, assume that the Woop Woop Amateur Radio Club Inc wishes to install a repeater on Mount X (I will refrain from A or B so as not to offend some political teams which don't exist!!) on the frequency 146.XXX. We need to ensure that under normal circumstances it will effectively cover the target area, that it will not co-channel another repeater within effective range, and that stations in between repeaters that are co-channelled cannot access more than one repeater at a time under normal conditions. It may be desirable to that one station to be able to access co-channelled repeaters, but for everyone else it is a bit like the wife having to agree to and accept a mistress for you! There are a host of other reasons, but this should convey the idea.

Because of these factors, I regret to say that many repeater approvals are being delayed. I am deeply sorry for this, but I am not the cause of the political upheavals within the Division, and can only do what I can with the resources provided.

Despite these problems, I am happy to announce that progress has been made on quite a few applications and I am sure that the clubs in question will soon be receiving their results. I would ask those still waiting to be patient, and we will dispense with the backlog as soon as we can.

It occurs to me that some of you may wish to donate maps to speed this process up. If so, please do not buy new maps and send them in to us in the first instance! I can envisage 47 maps all of the same area arriving on the Divisional doorstep ... all of them being for an area where there are no repeaters!!! If you are so inclined, I suggest you contact your local radio club and have them liaise with us as to which maps would be useful!! Better yet, you could ring me direct on either of the following numbers.

(018)295545 ... at all odd times as I work swinging shifts!
(02)6097383 ... this has an answering machine on whether I am there or not!

Once again I thank you for your patience and hope to be able to bring you the good news that all the backlog has been cleared up. I would also like to publicly acknowledge the tremendous efforts put in by Barry Sullivan. It is only through Barry's help that we have made any progress at all.

Remembrance Day Contest weekend WIA broadcast schedule

PLEASE NOTE
Next weekend is the annual Remembrance Day contest which honours those amateurs who paid the supreme sacrifice in World War I. As a result there will be NO WIA broadcast next Sunday morning. It will be replaced by a special broadcast on Saturday evening starting at 5.30 pm which will lead into the R.D. address. The R.D. Contest itself will start at 6.00 pm and as a result there will be no callbacks.

Please take part in this important contest. Your log, no matter how small, will help return the R.D. trophy back to its rightful place -- the VK2 Division.

Again, due to the R.D. Contest starting on Saturday at 6.00 pm there will be a special broadcast at 5.30 pm followed by the R.D. Address, then the Contest start at 6.00 pm. There will be no WIA broadcast next Sunday morning. The broadcast on Sunday evening will be as usual.

submitted by Dave VK2KFU

WICEN news

As listeners may have noticed the Sydney WICEN repeater on channels 7150/8275 is now back on air following an extended holiday. Along with various repairs, it is now running on a high-gain antenna for which we would like to thank Dick Smith Electronics.

There are no new events on the WICEN calendar in the immediate future, so in the meantime here are the events this month. The annual Batemans Bay Car rally is on Saturday 13th August, and as before Steve VK2XNH is looking for volunteers. This is followed by the annual City to Surf Fun Run, on Sunday 14th August, and Eric VK2KUR is looking for volunteers for this fun event. There will be the usual barbecue afterwards, at the usual place, and listeners are advised that communications will be conducted on UHF to avoid pager interference. Eric advises that those without access to 70cm need not worry. Hunter WICEN meet on Monday 15th August, and Sydney South will have their AGM on Tuesday 16th August. Those members who are also involved in other emergency services may be interested in the "Rescue Expo" at Darling Harbour on Sunday 21st August. This is followed by the Windsor-Sackville Regatta on Saturday 27th August, from 0730 to 1330. There will be three checkpoints, one dry and two wet, at Windsor, "station 48", and Sackville Ferry. Contact details are scanty at the moment, but

interested personnel may contact John Buxton VK2GJB.

WICEN is always looking for members to provide the community with communications assistance. Write to WICEN (NSW) Inc, PO Box 123, St Leonards 2065 for further information, or come up on one of the WICEN nets: Blue Mountains on the first Monday of each month at 8.30pm on channel 7175 simplex, Hunter each Wednesday at 7.30pm on channel 6900, Northern Rivers each Wednesday at 8pm around 3610 kHz, Central Coast each Thursday at 8.30pm on channel 7125, and Sydney each Thursday at 9.30pm on channel 7150. If there are any other regular nets then we'd like to hear about them.

-- Dave VK2KFU, WICEN (NSW) Inc. Publicity Officer

1994 City to Surf

Only one week to go to the City to Surf fun run and WICEN is still a few operators short. Remember it is next Sunday August 14th.

If you are able to assist would you please let Eric VK2KUR know in the next day or so on home (02) 337-2909 or at work on (02) 318-6138.

As with last year's event we have again been able to organise the same briefing venue and will again be holding a barbecue afterwards. All participants along with their families and friends are welcome to attend. With some operators finishing much earlier than others, they will be able to head out to the hall and maybe have an early lunch whilst waiting for the rest to return. This way we won't have everyone trying to use the BBQ at the same time.

So bring your along yourselves, your families or friends and your food and drinks. There is plenty of room for the kids to play round the hall. You can leave your food in the fridge whilst you are out and cook it when you get back.

Again Eric's numbers are at home (02) 337-2909 which has an answering machine as well or at work on (02)318-6138 between 0800 and 1600.

Submitted by Eric van de Weyer VK2KUR, WICEN Commander for 1994 City to Surf

Scouts and Guides: Jamboree on the Air 15-16 October 1994

Epping District -- Base operators wanted

A new base for JOTA, the annual world-wide Scout radio activity, is being opened at Epping and licensed operators are needed to bring and operate equipment capable of interstate and internation-al contacts.

The aim of JOTA is to contact and record as many other Scout Bases as possible in the weekend, as well as to provide an opportunity for youth and adult members to become involved in Radio. Over 20 local Scout Groups will be invited with a potential attendance of over 500 during the weekend.

The Epping JOTA Base will operate (subject to availability of Operators) from
8am - midnight Saturday 15 October, and
8am - 4pm Sunday 16 October
and is located at 6 Essex Street, behind the RSL Club. Meals, refreshments and overnight accommodation if required, will be provided to Operators, and all equipment used is insured by the Scout Association.

Please help us to run this valuable activity, and increase public awareness of Radio as a hobby and a career.

For further details and to register our availability please contact
Geoff Booth, Group Leader (H) 868-1061
(M) 015 214 626

IPS USER TRAINING COURSE

SYDNEY
Tuesday 13th September 1994

In order to increase the value of IPS Radio and Space Services to its customers, a one-day User Training Course is offered in the use of IPS Predictions and Warnings. The courses are presented on a regular basis at locations throughout Australia. A one-day course will be given in Sydney on Tuesday 13th September, 1994 starting at 9am.

The course consists of three sessions, covering the following topics.

SESSION 1 - The scientific background to IPS predictions

* The ionosphere and its formation
* Reflection and absorption of radio waves
* Ionospheric variations
* Mapping and predicting the ionosphere

SESSION 2 - HF radio propagation and prediction formats

* Oblique propagation
* IPS Predictions and formats

SESSION 3 - Short-term disturbances caused by the sun

* The sun-earth environment
* The main types of solar activity
* The terrestrial effects of solar activity

* Warning services provided by IPS

The courses are followed by a demonstration of the Advanced Stand Alone Prediction System, ASAPS.

The presentation of the course is based on overhead transparencies. each person receives a copy of the IPS User Training Manual which includes copies of the transparencies used, along with relevant descriptive text, and information describing IPS services.

Generally, the courses are aimed at the HF communicator, but the presentation can be tailored to suit the audience by emphasizing topics of special interest. You should indicate your particular speciality or interest (e.g. communications, geophysics, etc) on the form (available from IPS).

The course normally occupies the period 9am to 3.30pm.

The venue for the course will be:-

Training Room 2
1st Floor
15 Help Street
Chatswood, Sydney

The venue is close to Chatswood railway station.

If interested in attending the course, please fill in the registration from (available from the Divisional Office or IPS), and return it to IPS by Friday 2nd September 1994.

The registration fee is $130 per person or $800 + $50/person for groups of more than ten. Payment may be made by cheque, credit card or an invoice will be mailed after the course.

For registration forms contact IPS : phone (02) 414 8335
fax (02) 414 8340

Cancellations

A full refund will be made for cancellations received in writing (letter or fax) by 30th August, 1994 while a 50% refund for cancellations (in writing) will be made up to 6th September, 1994. No refunds will be made for cancellations received after the 6th September.
Alternatively, if you are unable to attend, you may nominate another person.

Astronomy Open Night

The Sutherland Astronomical Society presents Astonomy Open Nights for the public.

Come along to the Green Point Observatory Friday August 12th and
Saturday August 13th, 1994

What's on Where to go
--------- -----------
Powerful telescopes will show you Location: Cnr Green Point Rd.

SUMMARY OF ACTIVITY

Solar activity was very low all week.

The geomagnetic field at Learmonth (WA) was quiet to unsettled 29th
to 31st July with one active period on 29th. The field then became
quiet through to the end of the period.

Ionospheric F2 critical frequencies at Sydney were near predicted
monthly values all week except for brief enhancements of up to 50
per cent during local night on 3rd August.

FORECAST FOR THE NEXT WEEK (5 - 11 August)

SOLAR: Very low.

GEOMAGNETIC: Quiet until August 10 then becoming active. Isolated
minor storm levels possible on August 12.

IONOSPHERIC: Near predicted monthly values for August. HF comms quality is expected to be degraded during interval August 10-13.

CLUB NEWS

Australian Amateur Television Club Inc.

The next meeting of the A.A.T.C. Inc is on August 14th - the 2nd Sunday of the month at 1.00 pm at Amateur Radio House, Parramatta.

The technical lecture on the day will be a demonstration of the IBM VGA to PAL composite video converter for ATV use, plus special information on our new 1250 MHz ATV receiver and finally, do not forget to bring that 1.4 meg blank floppy for special software release.

Lectures at the future at meetings will be on the correct use of oscilloscopes, plus how to make coaxial cable aerials together with hints on assembly of the 1250 MHz receiver and hi gain pre-amp.

The A.A.T.C. welcomes any one with a technical interest to attend and enjoy the club's technical presentations.

The date for the AATC members only PCB workshop day is to be organised.

For more information about the A.A.T.C. listen to the net on Tuesday nights from the Liverpool area on 146.625 MHz - approx. 19.30 hrs - or watch us on 1250 MHz from our Oakdale repeater any-time.

AATC Inc. Publicity Officer Bob Barnes VJ2R

VHF-UHF DX Group

The next VHF-UHF DX Group meeting will be held on Tuesday 20 September at Amateur Radio House. This meeting will be an equipment workshop on the construction of high power linear amplifiers and low noise preamplifliers.

Working examples of linears and preamplifliers will be exhibited to demonstrate how practical construction problems are solved.

The Group also sponsors activity nights on 144 MHz on Tuesdays and 70 centimetres on Thursdays. Things usually get underway after 8 pm.

Why not check into the Group's Sunday evening net on 146.5 MHz FM for details of Group activities. The Sunday evening net starts at 8:15 pm.

Submitted on behalf of Richard Sourlie VK2ARS

Great Lakes Radio Club news

At the Annual General Meeting of the Great Lakes Radio Club Incorporated held on Friday, 29th July, the folowwing office-bearers were elected:
President Stan Ellis VK2DDL
Vice-President Ray Parry VK2JRP
Secretary Shayne McBride VK2XUV
Treasurer Daryl Waldock VK2DAZ

Although comparatively small, the Great Lakes Club is well-known because of the wide coverage of its 2-metre repeater, VK2RGL, located 40 kilometres due west of Forster, on the Mid North Coast, and also because of th key role which its digipeater, with the same callsign and location, plays in the North-South forwarding of Packet traffic on the Rose system.

The club is fortunate in being able to draw on the expertise of a number of members with extensive experience in the commercial radio and television fields, and the benefit of their contributions is apparent in the performance of its repeaters.

The club meets at 7.30 p.m. on the last Friday of each month except December at the Forster-Tuncarry Adult Education Centre at the corner of Manning and Lake Streets, Tuncurry and, in keeping with the tradition of hospitality which is so widely practised in this holiday area, is always happy to welcome visiting amateurs, whether on vacation or simply passing through.

Following on reports and plans discussed at the A.G.M., members are looking forward to another year of progress and expansion, and hope to see the establishment, in the near future of a training scheme for anyone in the local area who may take an interest in our hobby. An application is being made for the accreditation of several members as examiners. Aspiring amateurs in the area from Bulahdelah to Taree are asked to listen for future bulletins announcing the commencement of the scheme.

From Stan Ellis VK2DDL

Waverley Amateur Radio Society

If you would like to be able to design and build professional quality printed circuit boards, you should attend the next meeting of the Waverley Amateur Radio Society where Bob Barnes, a professional PCB maker, will demonstrate the shareware Protel circuit design tool. Copies of this software will be available at the meeting. A follow-up session, where board production will be demonstrated will be arranged later.

If you are interested in a cheap way into packet radio, you should build the Society's low cost Baycom modem. Key components for this can be purchased at the meeting.

The meeting will be held at 7:00 pm on Wednesday 17th August in Waverley Council's new multi-purpose centre at

31 Spring Street, Bondi Junction,

which is located close to the railway station.

Simon Buxton - VK2EII - Publicity Officer

Central Coast Amateur Radio Club

The Central Coast Amateur Radio Club will be holding a Flea Market at its club rooms on Saturday 20th August. As a result, the usual mid-month Friday lecture night will not be held in August.

The Flea Market will commence at 1.00 p.m. and a number of trading tables are available in the Club Rooms. Vendors can also trade from their boots, tailgates or trailers in the carpark.

No fees will be charged to traders and free of charge tea, coffee and biscuits will be available during the afternoon.

Bargains abound, so come along to the Central Coast Amateur Radio Club Flea Market, commencing at 1.00 p.m. on Saturday 20th August at the CCARC Club Rooms in Dandaloo Street, Kariong, and help re-cycle some of the trash and treasure from the 1994 Gosford/wyong Field Day.

From Bob Fitzgerald, VK2XRF, CCARC Publicity Officer

Liverpool and District Amateur Radio Club

The next meeting of the club will be held on Tuesday 9th August at the lecture hall of the Scout camp in Cambridge Avenue Liver-pool at about 7.30 pm.

To hone your DF-ing skills, we will be holding a couple of pedestrian foxhunts in the dark, so bring your gear with you.

See you on Tuesday night.

And a cheerio to Henry VK8HA who has gear problems and can
listen but not transmit. Hope you are hearing us Henry.

ANARTS officebearers for 1994-1995

Last night the deferred elections for 1994-5 were held and the
retiring committee was re-elected unopposed. So, if you can't
remember who's who, here's a list:

President Col Davies VK2CTD
Vice President Jim Swan VK2BQS
Secretary Pat Leeper VK2JPA
Treasurer Alan Fall VK2DPM

Col has volunteered to be Newsletter Editor, and Pat is
again the Boadcast Officer.

Can you help us in any way -- with news items, or perhaps you
could volunteer to be a backup relay operator in time of
illness etc. If you can, let us know via the callbacks on the
different frequencies, or drop a packet message to VK2JPA at
VK2AAB (until VK2RWI comes back on air). Your assistance as
always will be greatly appreciated. Local news from your club
is always welcome -- any news in the digital field of amateur
radio.

Snippet from the contest replies

No - nothing to do with the contest - but did you know that
the Maple Leaf Radio Society in Canada runs a Maple Leaf award
for contacting Canadian prefixes. What was surprising to us

was the number mentioned in the various awards, with the top award going to those contacting 200 prefixes!

We had no idea Canada had so many prefixes -- these date from after February 15 1965, the date when Canada received its official flag. The club is located in Ontario at Listowel, and if you are interested, we will include the full address from the leaflet which arrived with a contest log from Canada.

ARLD045 DX news

The items in this week's bulletin are courtesy of Bob, WB2CJL, Joe, NJ1Q, Paul, KB1BE, 9V1ZP, the OPDX Bulletin and the YCCC DX PacketCluster network. Thanks.

SENEGAL. Jean-Louis, 6W6JX, is very active on 40, 30, 20 and 15 meters between 0630 and 0930z, and again from 1630 to 1900z. QSL via CBA.

EASTERN MALAYSIA. Dave, 9M8BT, has been heard on 14220 and 14226 kHz operating free style between 1315 and 1500z. QSL via N5FTR.

ANGOLA. Rich, D2/AA4HU, was on the 14226 DX Net around 2245z.

BANGLADESH. Erik, S21ZG, was recently heard calling CQ on 14006 kHz at 0108z with very few takers.

BRUNEI. V85KX was very active on 14025 kHz between 1230 and 1430z. QSL via G3JKX.

MAYOTTE. Elio, FH5CB, is on almost daily. Check 14256 kHz between 0400 and 0500z. QSL via FH8CB.

FAROE ISLANDS. OY1R was heard on CW between 14040 and 14050 kHz from 1245 to 1545z. QSL via W2KF. OY1HJ was on SSB at 14258 kHz around 1515z. QSL via OY6FRA.

SINGAPORE. Michael, 9V1ZP, phoned the DXCC Desk on Friday to announce that 9V1 stations will be signing S61 plus their regular suffix for one month starting August 13, 1994. This is in celebration of the 25th anniversary of IARU member-society SARTS, the Singapore Amateur Radio Transmitting Society.

SUBSCRIPTIONS.

Members are reminded that ANARTS Financial Year commenced on 1st July 1994 and that subscriptions are now due. We have had a freebie for 12 months as a gesture to our members but it could not continue that way for ever.

So please send $10 (you know, the pretty blue note) to our Secretary who will process it under our new system which should prevent delays and transit problems.

Send to the official ANARTS address at Box 860, CROWS NEST. NSW. please.

Society information

The Society may be contacted at : PO Box 860, Crows Nest 2065 Australia, for such matters as membership and general enquiries. Enquiries can also be made by packet to the President (Col) VK2CTD, or the Secretary (Pat) VK2JPA at VK2RWI.

News items may be sent to Broadcast Officer PO Box 60 Blacktown 2148 Australia, or by packet to VK2JPA at VK2RWI. Email addresses for the Broadcast Officer are :

patl(at)pitt.conmusic.su.oz.au

The Society welcomes news items on any digital subjects from anywhere in the broadcast coverage area. We know we reach New Zealand and many South Pacific islands, and we were reaching as far north as Japan when conditions were right. We are looking forward to news from your areas to let other amateurs know what you are doing in the hobby. Hope to hear from you.

73s de Pat VK2JPA Broadcast Officer
That concludes the broadcast for this morning/evening.

HEMPSTEAD vs. NADEL

The town of Hempstead, New York has found yet another legal loophole to again deny a ham the right to have an Amateur Radio tower and antenna. Newsline spoke to Mark Nadel, NK2T who has taken on Hempsteads anti ham radio stand. He says that after all this time, it may be back to square number one.

"Wednesday July the 13th the town of Hempstead had come up with and absolutely incredible maneuver. And what they have done, they have now dismissed the application without prejudice. The town of Hempstead has decided that what has happened here is we have not presented our case. They feel we did not show why we needed a 55 foot height. Unfortunately, the information was presented in the case very thoroughly by three of four different technical experts.
But the judge in his ruling left it open quite wide open. What happened here is the judge left a lot of it up to interpretation for the town to rewrite their findings. Did not give them direction, so when the town interpreted the rewrite. They rewrote it with extremely strong language and dismissed it, they didn't deny it. They dismissed it!" Mark Nadel, NK2T.

Nadel says that he really has only two options.

"At this point according to legal counsel, are to either to file an additional article 78, go through the courts. Or possibly reapply for a whole new series." Nadel, NK2T.

Nadel tells Newsline that a group called Radio has been formed to help defray his legal expenses. Radio sponsors it's own automated telephone line to keep hams updated on this precedent setting case. You can hear these bulletins by dialing area code (516) 735-2500 for regular updates on the Hempstead, New York tower case. Litigation that could eventually impact hams throughout the Empire state.

(*****
FCC TO REORGANIZE

A late breaking story. Dateline Washington, DC. Ham Radio will be loosing two of its staunchest supporters in key positions at the FCC. This, after a decision by the commission to add two

new bureaus and totally reorganize a good part of its operations. A new Wireless Telecommunications Bureau is to have as a co-deputy chief Ralph Haller, N4RH. Ralph is currently chief of the Private Radio Bureau, as a ham and a FCC official is well known to most amateurs.
Also, Richard M. Smith, now head of the Field Operations Bureau, is to be chief of a new Office of Engineering and Technology. Beverly Baker, who is now deputy chief of the Private Radio Bureau, is to replace Smith at the FOB.
The changes are not immediate. Any reorganization will become effective only after formal Commission and Congressional approval has been obtained. Exactly what impact these changes will have on ham radio, and who will tapped to replace N4RH at the Private Radio Bureau are questions that remain unanswered as we go to air.

(*****
PIRATE RADIO STATION CLOSED DOWN

A pirate broadcast station has been closed down by the FCC. This, after a listener complain about interference to his favorite station.
After finding that he could no longer receive KQED-FM, a San Francisco educational station on 88.5 MHz the San Jose listener complained to the FCC. The Commission dispatched a direction-finding vehicle to the San Jose area. There, investigators found an unlicensed station transmitting music over an area of 25 square miles using a fairly powerful transmitter. As a result of a station inspection, the unlicensed operator ceased operation. This being an egregious case of blatant disregard for government regulation, the FCC says that a Notice of Apparent Liability to Monetary Forfeiture will definitely be issued in this case. The FCC release did not say weather or not the pirate broadcaster was a ham.

(*****
TWO CABLE SYSTEMS SHUT DOWN

Two cable television systems were recently ordered stop the use of certain channels because of excessive system leakage. Last April 13th and 14th, the FCC's Detroit, Michigan engineers monitored the cable systems serving the cities of Williamsburg, Corbin, and Kentucky finding several large signal leaks. Engineers soon discovered two cable television systems that had excessive radiation on aeronautical frequencies. Both systems exceeded the Cumulative Leakage Index limit and required that the Detroit Office's Engineer in Charge shutdown cable operations on frequencies that could pose a threat to reliable aviation communications.

(*****
WEATHER WARNINGS

Members of the FCC's Emergency Broadcast System staff have held a meeting with the National Oceanic and Atmospheric Administration to design an integrated approach to an "All Hazards Warning System." The National Weather Service Radio and the NWS transmitters would be incorporated into the Emergency Broadcast System. Currently, NOAA weather broadcasts cannot be heard everywhere by the general public. The new technologies described in the Commission's recent Report and Order could be used to relay the weather broadcasts to more people.

(*****
NATIONAL EMERGENCY COORDINATION NET

The FCC's own radio stations began participating in FEMA's National Emergency Coordination Network -- a network of government radio stations. Its purpose is to establish a backup communications system so that government stations can coordinate with each other during emergencies when telephone circuits are inoperable. Fourteen FCC offices participated in a recent communications exercise, which happened to coincided with the start of the 1994 hurricane season.

ARRL PRESENTS AWARDS

The ARRL Board of Directors has issued a number of awards to members of the nations Amateur Radio community for their ongoing contributions to the service. In recognition of more than ten years of successful SAREX missions aboard space shuttle flights, the ARRL Board has expressed its gratitude to the SAREX Working Group. The group was commended for its efforts to make Amateur Radio communications a part of past, present and future space missions, including the Space Station.
Jonathan M. LeBretton, N1MJM, of Plymouth, Massachusetts, was selected as the 1993 Hiram Percy Maxim Memorial Award winner; James Dalley, W0NAP, of Centerville, Utah, was selected as the Herb S. Brier Volunteer Instructor of the Year and the Board picked Sheila Perry, N0UOP, of Bloomfield, Missouri, as the 1993 Professional Educator of the Year.
Rick Campbell, KK7B, of Chassell, Michigan, was selected at the winner of the Technical Excellence Award for his article, "High-Performance, Single-Signal, Direct-Conversion Receivers," appearing in the January 1993 issue of QST.
The Board also tabbed Newslines good friend Len Winkler, KB7LPW of Phoenix, Arizona, be the recipient of the Philip J. McGan Silver Antenna Award. This award recognizes outstanding achievement in the public relations arena. As many of you already know, Len Winkler is the host of the live national ham radio call-in program "Ham Radio and More" that originates from the studios of KFNN radio in Phoenix and is distributed nationally by satellite.
The ARRL Board of Directors has also created the Professional

Media Award was created to recognize journalists and other professionals who make distinguished contributions to the public image of Amateur Radio. Details on this will be announced shortly.
The Board also thanked all Amateurs for their public relations efforts.

(*****
COURT UPHOLDS KV4FZ CONVICTION

A Virgin Islands Federal Appeals court has denied an appeal by Herbert L. Schoenbohm, KV4FZ to have his telephone related fraud conviction overturned. In April of 1992, Schoenbohm was convicted on a three count indictment. Later, convictions two and three were overturned.
Schoenbohm then filed a motion for a new trial and for acquittal on the remaining count. Both motions were denied because in the courts view there was enough other evidence to uphold a conviction on count number 1.
Schoenbohm had also filed a motion for correction of sentence. At the resentencing he received two months of incarceration which the court suspended. He was also forced to serve two months of house arrest.
KV4FZ's next move was to file appeals before the United States District Court for the Virgin Islands. On July 22nd that body ruled again that there was sufficient evidence for the jury to have returned a verdict of guilty on count number 1.
The court also denied Schoenbohm's motion for a new trial It found that other evidence thrown out in dismissing counts 2 and 3 would not have denied Schoenbohm a fair trial.
At this point Schoenbohm has only two avenues open to him. He can request the same appeals court reconsider its decision or he can attempt to take the matter directly to the United States Supreme Court.

(*****
MOTOROLA PROBLEMS

Problems continue for two rival companies in their attempt to land a contract to install a new land mobile emergency communications system in Birmingham, Alabama. The latest development is the disclosure of a memo that puts one of the two bidders in a not so good light.
The controversy started when the city chose Motorola over Erickson GE. Motorola's bid was nearly a million dollars higher. Erickson GE filed suit against the city and Motorola. Erickson GE says city officials suggested that paying money could help win influence on the companies behalf.
Adding to the controversy is an internal memo Motorola wrote to the cities communications consultant. That memo mentions what it calls numerous "Gothas". They were included to cause Erickson

GE, again quoting "much grief". The memo goes on to say that the consultant tried to make sure it didn't look too obvious that he favored Motorola. The consultant describes charges he tried to design the bid to favor Motorola as a complete lie.
While the case remains in court, Motorola continues with plans to install the system. The city has already paid Motorola part of the systems $11.3 million price tag.
It seems obvious that the city of Birmingham wants Motorola equipment for its new radio system. The question is whether or not the courts hearing the case will allow the city to get its way.

(*****
SAREX CELEBRATES APOLLO 11

In commemoration of the twenty-fifth anniversary of the Apollo 11 mission, the STS-65 SAREX station on board the Space Shuttle Columbia operated as a special event station from 17:13 UTC, July 19 until 13:43 UTC, July 21.
The SAREX station joined at least 12 other amateur stations associated with the National Aeronautics and Space Administration in commemorating the landing of the Apollo Moon Lander Eagle on the moon's surface in 1969.
Contacts made during the event will be eligible for a special commemorative certificate. Please send your report and QSL with a large 9-inch by 12-inch self-addressed stamped-envelope to the ARRL Educational Activities Department, STS-65 Apollo Special Event, 225 Main Street, Newington, CT 06111.

(*****
CHINESE HAM EXAMS

On the international scene, word that the first ever Individual Amateur Radio Operator's License exams were scheduled to be held July 16 and 17 in up to 26 cities. Organized by the Chinese Radio Sports Association, the tests covered five different categories of hobby radio operations. These include two types VHF only amateur radio, two types of high frequency licenses and a special class for Chinese citizens who want to own a shortwave receiver to SWL. Different requirements exist for the different classes of hobby radio operations. The contents of these exams are said to have included Chinese radio regulations, approved communication procedures and radio theory. For high frequency operation the tests also included examinations on international phonetics and Morse code. No word on how many candidates were tested, and how they did.

(*****
HAM RADIO AIDS FLEEING CUBANS

Also, the United States Coast Guard, the FCC and ham radio recently teamed up to help bring some Cuban nationals who were

fleeing the tyranny of Dictator Fidel Castro to sanctuary here in the United States. When the Coast Guard received a report from a ham radio operator in Panama that a vessel carrying individuals fleeing from Cuba was being fired upon by a Cuban patrol boat, it requested FCC assistance to confirm the distress and to provide a location fix. The FCC direction-finder network pinpointed the signal.
The information was verified and then relayed back to the Coast Guard which dispatched a plane and patrol boat. Sixty four Cubans, including four wounded, were found aboard the boat. All were transported safely to Miami.

(*****
JOHNSON OBIT

Some sad news to report. Jerold Robert Johnson, WA5RON has died. Better known as Ron Johnson to his many friends in ham radio, he was a former director of the Texas VHF - FM society and helped in the development of many of the band planning techniques now commonplace in VHF and UHF repeater operations nationwide. Ron was also the deputy director of the Mutual UFO Network as well as a member of AMSAT North America and the Austin Amateur Radio Club. He is survived by his wife Rox Ann and to young sons. Ron Johnson WA5RON was only age 43.

(*****
DX

In DX, a six week SSB only operation from the Northern Cook Islands as ZK1KH is in the planning stages. No date has been mentioned but the operators will favor 21.177 and 28.490 MHz. Meanwhile AA6LF has wrapped up his ZK1ALF stint and is on his way home.
Also, S92SS from Sao Tome has been heard on the WARC bands. Check 18.087 or 10.109 MHz around 22:45 UTC. If not there, check 20 meter SSB between 21:00 and 23:00 UTC. Another station signing S92YL has also been active from Sao Tome on 15 and 20 meters between 20:30 and 21:30 UTC as well.

(*****
LONG DISTANCE CUSTOMERS

The Ferndale Office Washington FCC office recently received a strange interference complaint. This, from a person who was receiving interference from his own personal computer to various radio and television receivers in his home. Apparently the computer manual provided FCC contact information as to where the user could receive the Field Operations Bureau's interference handbook and request other assistance.
Nothing special here you say. Well, heres the kicker. The call came all the way to Washington State from Barcelona, Spain. The FCC says that particular complainant will not receive any

on-site investigation.
Yea, we can just see the FCC staffers. You know -- arguing
over who will have to make that "terrible" 10 hour flight to
Barcelona. Its probably better that they passed this one up.

2159. Re: Help! How to Improve my CW Speed?

Newsgroup: rec.radio.amateur.misc
Date: 1994-08-08 11:07:22 UTC
From: michaela@freenet3.scri.fsu.edu
Message-ID: <3253la$lnl@freenet3.scri.fsu.edu>
Source record: 262114

Hi, Yuzu [AA1JA]--Practice and more practice, pal. You cannot "force" it to happen to break the plateau; it will simply happen some day.

A more regular schedule of operation would be a big help--i.e., "daily" for an hour is superior to "weekly" for several hours. Obtain a transceiver somewhere and set up a small station at home and operate from there--that will get your practice moving much more regularly. Failing this, obtain and listen to tapes each day. Copy the text from W1AW to get new material. [Tapes are nice because you can carry them around with you and "catch" five minutes here and five minutes there during quiet times of the day.

High speed CW operators are not hatched overnight or even in a few months; it takes years in the tenches under a variety of conditions, i.e., contests, ragchews, DX chases, practice-only sessions.

Like a fine bottle of wine, the CW operator cannot be rushed to maturity, hi. Good luck.

[BTW, I did not take your first posting as humerous or a joke. I could see you were very sincere and perhaps a little frustrated. Hang in there; it will happen.]

Michael Christie, K7RLS
Crawfordville, Florida

Source record: 262116

Yuzu--just a tad more, if I may.

Using a tape, put the pencil down. Deliberately force yourself to start to learn to copy in your head. It is simply a new approach to an old, familiar theme. You will start hearing words [or parts of words] and not letters.

There are a variety of methods to copying CW. You've learned one to about its end, i.e., letter-by-letter. Try deliberately this new approach. You'll fall back [speed-wise] but that will be only temporarily; you will recover and pass your old maximum speed in time.

In-the-head copying will never be 100% "solid" at first [perhaps later] but it will soon get you over your plateau and you will start to feel much more comfortable at 30+ wpm. Later, the "solid" copy will be there at 30 wpm while the fractionated, in-the-head copy is up at 35-40 wpm. You need to learn a new method of copying in order to bring along your old letter-by-letter method of 100% "solid" copying. 73,

mike, k7rls

2161. MFJ 20-m SSB rig?

Newsgroup: rec.radio.amateur.misc
Date: 1994-08-08 11:59:58 UTC

SB PROP @ ARL $ARLP032
ARLP032 Propagation de KT7H

ZCZC AP46
QST de W1AW
Propagation Forecast Bulletin 32 ARLP032
>From Tad Cook, KT7H
Seattle, WA August 6, 1994
To all radio amateurs

SB PROP ARL ARLP032
ARLP032 Propagation de KT7H
This is a correction to ARLP031. Some copies of the original
went out without the last paragraph.

Solar activity is quite low. Over every day last week the flux
values were lower than the average for the previous ninety days, and
both the flux and sunspot numbers were slightly lower than the
preceding week. This does not look good for HF propagation in
general, and the higher bands in particular. At least geomagnetic
indices have been quiet and in the single digits. The only
unsettled day last week was July 28, when the A index went to 17 and
the K index briefly to four.

Activity should pick up a bit this week, with the flux expected to
stay around 80 until the middle of the month. There may be some
slightly active periods around August 12 and 19. Flux values should
drop back to around 75 by August 20, and remain there through the
beginning of September.

Sunspot Numbers from July 28 through August 3 were 25, 11, 25, 14,
33, 24 and 19, with a mean of 21.6. 10.7 cm flux was 74.8, 75.7,
75.3, 75, 74, 75 and 76, with a mean of 75.1.

The path projection for this week is from Phoenix, Arizona to the
Marshall Islands.

80 meters looks good from 0630z to 1330z, and 40 meters from 0530z
to 1400z. Check 30 meters from 0430z to 1500z, and 20 meters around
1830z to 1930z and again from 0200z to 0900z, peaking around 0600z
to 0830z. Another 20 meter opening is probable around 1330z to
1445z. 17 meters looks good from 1830z to 0600z, and 15 meters
looks good on most days from 2200z to 0230z. 10 and 12 meters do
not look promising over this path at this time.

2165. FORD RF NOISE

Newsgroup: rec.radio.amateur.misc
Date: 1994-08-08 14:29:37 UTC
From: jwc@col.hp.com
Message-ID: <325fgh$rt5@hp-col.col.hp.com>
Source record: 262120

For late model Ford Explorers, Aerostars & pickups.
Some products have a long 'ground' lead from the fuel pump (in fuel tank) to left front fender well area.
This makes great antenna to radiate rf noise from the fuel pump.
Bonding this lead to frame as close as possible to fuel tank will aleviate most of the noise problem. A rf choke from Ford or Radio Shack may still be necessary for some instalations.

Those vehicles that have the factory "TOW' package will have common ground in the harness for the trailer hookup which may be utilized for this purpose.

This the official Ford fix from 'Ford Light Truck Engineers' at FCSD Hotline in Dearborn.

Feedback concerning this field fix can be directed to:
Mark McIntyre A.S.E.T.
1-800-762-1103

I will also hand carry E-mail to Mark if necessary.

Personally I'm only involved as a Ford owner and Amateur radio operator.

John, N0KIC.....73

>Sunnyvale, California The Biederbecke Affair

Walt, if it is the Sunnyvale library you are talking about, they
have semi-annual bound volumes back to the 40s, I think. And fiches
for the era before that. The last time I used that service was maybe
two years ago. Maybe they have changed since...

They won't let you take the bound periodicals home...

The Sunnyvale library is probably a little unusual. Take a look
at the zip code statistics in the U.S. callbook for the zips which
begin with 940.

Andy, what make was the car you were planning to buy when you got this treatment? It'd be useful to know what to avoid.

I suspect your friend may have other problems causing the X-10 to trigger, like high RF levels do to antenna problems. I suspect he may also be having RFI problems with other devices in his house.

I run up to a KW on 40 through 10 and have not had a problem with RF triggering the X-10s. Touch lamps are another story. Those darn things tolerate very little RF. I have had some success in keeping RF out of the lamps by wrapping the power cord in a toroid core (Radio Shack #273-104).

When I bought my Ford Ranger two years ago, we were on the verge of signing the contract when I inquired about installing a mobile rig and how it would affect the warranty. The salesman turned white as a ghost and wanted know if it would affect the deal. I told him it most certainly would. Upon checking, I found a warning in the owners guide about operating more than 5 watts inside of the cab no mention of warranty voidance. I went ahead and bought the truck. The only thing I notice is that it slows down slightly when I'm running with cruise control and I transmit on 440 at high power (35 watts).

I don't understand why someone would think your request was a joke. High
speed CW is a skill that not many hams have aquired. I am like you, I
copy by letter and can not copy behind. I am interested in any tips you
get on this subject.

I know a few CW DX'ers that can copy CW above 35 WPM. They all can
copy in their head. Hearing words and not letters is the only way you
can copy high speed CW. I don't know how they got this ability, but I know
most of them have had many years of practice.

Good luck.

From: dpt@ri.cadre.com
Message-ID: <Cu8B69.7oA@cadre.com>
Source record: 262046

This is a very good question. I have found that going 30-35+ wpm does require some new techniques. Below is a list of things that have worked for me...

1. Practice on the air with stations that are sending at or slightly over your ability to copy. This sets up a challenge.

2. Put your pencil down and try to recognize whole words as units, rather than mechanically copying characters down on paper. Only use the pen to jot down notes. You will naturally recognize commonly used words like QTH, the, is, rig, name, etc immediately. You will be suprized at how may words you already know. For all the other words that you don't know:

3. Form the word mentally in your mind, rather than using a pen.
Visualize the characters of the "current" word in your mind. Its almost like drawing the word in your head and erasing it as the "next" word arrives.
It helps sometimes to close your eyes while doing this. (Rememeber your mind can draw characters faster than your hands - so your not limited to how fast you can write/type, which is usually what causes the platue to begin with).

4. As the"current" word is completely formed, your mind will take some finite time to recognize it. If you take too long, you may miss the next word...
My advise is to simply let the current word go and focus on bagging the next one. This is the key. If you don't let it go, you will probably miss the next word and the next, losing the whole context of the phrase. This is the hardest part of copying in the head. Give up one, to get the rest...

5. As you get better at this, your mind will develop the ability to "copy behind". That is, your mind has the ability to both work on recognizing the "last" word and at the same time visualize the formation of the next word. This takes alot of practice.

6. Relax. Don't get too nervous about missing a word. Always look ahead! The key is too minimize the number of missed words, not bag every last word.

7. As you copy words, think about the context of the sentance or phase being sent. Many times you can "anticapate" the next word(s). You probably already do this when copying code on paper.

8. Enter into a real conversation, not just QTH is, RIG is, etc... but a conversation that you may have in person.

9. Practice.

Copying in your head really allows you to use CW as a second language. It is not as difficult as it sounds, but it does require some work. But once you learn how to do it consistently, it is extremely enjoyable. And you will meet some very interesting

people young and old. Enjoy...

I agree totally with mike, it does sound like a "letter for letter"
problem.

I would like to add one more tidbit of advice.

Sometimes, when I am copying "in the head", it helps to visualize the words
appearing in front of my eyes. (I have designated this as the
"Gary Coffman Human Modem Technique" :-)

Once again, echoing what has been said before,

Keep on trying.

Message-ID: <3262fs$4ht@mozo.cc.purdue.edu>
Source record: 262045

I am looking for some info on charging gel cells. At what point should you recharge the cell (drop to what voltage), and how do you tell when the cell is fully charged? I put my cell on the charger when it dropped to 11.6V, and monitored the voltage while charging. The cell came back up to 13V fairly quickly, and after 2-3 hours the charge current was down to about 70 mA. Since I was going to bed, I disconnected the charger rather than leaving it on all night. Is there a voltage or current threshold for determining when the battery is fully charged? The cell has a 7Ah rating.

Greater than 2 MeV Electron Fluence for 26 JUL is: 1.0E+07

SYNOPSIS OF ACTIVITY

Solar activity was very low.

Solar activity forecast: solar activity is expected to be
very low.

The geomagnetic field has been at mostly quiet levels for
the past 24 hours.

Geophysical activity forecast: the geomagnetic field is
expected to be quiet to unsettled.

Event probabilities 27 jul-29 jul

Class M 01/01/01
Class X 01/01/01
Proton 01/01/01
PCAF Green

Geomagnetic activity probabilities 27 jul-29 jul

A. Middle Latitudes
Active 15/15/15
Minor Storm 10/10/10
Major-Severe Storm 05/05/05

B. High Latitudes
Active 20/20/20
Minor Storm 10/10/10
Major-Severe Storm 05/05/05

Normal HF propagation conditions existed over all regions
today. No changes are forecast for the next 72 hours. Normal
to possibly slightly above-normal propagation will continue.

2198. Upgrade to TECH PLUS ?

Newsgroup: rec.radio.amateur.misc
Date: 1994-08-08 20:31:29 UTC
From: davidc@lsid.hp.com
Message-ID: <Cu8H0I.GKF@hpcvsnz.cv.hp.com>
Source record: 262050

Since the FCC is now issuing TECH PLUS licenses does a no-coder who takes and passes a 5WPM test get a new license issued or do you still have to hang another piece of paper on the wall and, worse yet, carry another piece of paper around with you?

Hopefully I will pass 13WPM (passed my General written already) and can skip this whole mess. But just in case I only do 5 :-(I would like to know.

>>
>> RDE
>>

I started as a tech+ because I have always enjoyed code. I now have my general. Code has an elegance, beauty and simplicity that I don't find on the other modes. It may have been surpassed as the mode that can prevail under poor band conditions but it is something that I can personally decode without a machine (I like machines also).

I recently took my qrp rig (Heathkit HW-8) on a camping trip and although band conditions were not good and I didn't have much time on the rig, I did manage to work a station in Grants Pass, OR several times. In fact, since the trip we have worked at least a half a dozen times and are getting into a regular sked--sometimes on CW and sometimes on phone. So what started as a simple CW exchange is growing into a nice friendship.

I certainly think it is worth the effort. If you decide to go for it, I'm sure you'll discover the same "magic" as I and thousands of others have discovered.

As I mentioned, I do work qrp at times. However, I would recommend getting your 5 WPM and starting with a hundred watts to get your feet wet. I started with qrp and didn't make too many contacts in the first nine months. Finally I got a 100 watt rig and was able to make contacts easily and my code speed blossomed. Its nice to have both options. There is a lot of interest in qrp and new kits and homebrew designs are readily available. And as always lots of antenna work to make it all work better.

2200. VOA Internet Audio Debuts Aug. 15

Newsgroup: rec.radio.amateur.misc
Date: 1994-08-08 20:49:01 UTC
From: ck@VOA.GOV
Message-ID: <Cu8Htp.AL8@VOA.GOV>
Source record: 262048
Cross-posted to: comp.infosystems,comp.infosystems.gopher,rec.radio.amateur.misc,rec.radio.shortwave

The Voice of America will begin offering digitized audio versions of selected newscasts and other program segments in 15 languages on its public internet server on Monday, Aug. 15.

Program segments from the following VOA broadcast services will be included:

Arabic
Cantonese
Standard Chinese (a.k.a. Mandarin)
Czech
English (worldwide program thread)
French-to-Africa
Hindi
Hungarian
Korean
Polish
Russian
Slovak
Spanish
Swahili
Ukrainian

In most cases, we will offer two daily newscasts, one in the morning (local time in the intended audience area) and one in the evening. In a few languages, scheduling conflicts for the two VOA Master Control outputs available to us will restrict us to a single daily newscast, at least for the time being. Digitized newscasts from VOA's "Worldwide English" program thread will be available on the server throughout the 24-hour broadcast cycle.

We will have a README file at the top of the audio hierarchy that will explain the file formats we will support and provide some suggestions about downloading them.

These audio files will be available via anonymous FTP (from ftp.voa.gov) and the Internet Gopher protocol (Uniform Resource Locator gopher://gopher.voa.gov/). In accordance with U.S. law, program materials such as VOA newscasts and the VOA News and English Broadcasts radio newswire are provided exclusively for recipients outside the United States.

Youthnet NEWS Announcement
Alexis Leynes N9KYJ
E-mail: AlexN9KYJ@aol.com
aln9kyj@mcs.com
BBS: N9KYJ@W9ZMR.IL.USA.NOAM

IMPORTANT SURVEY FOR THE YOUNG HAM!
This is a very important survey, if you would want to send an opinion to me about Youthnet NEWS or anything else, please do so via my Packet address or my Internet E-mail addresses. Please include in your reply; your age, and a way to contact you for more information. There is no age limit for this survey, and all messages will be returned with a reply. Here are the questions:

1. What made you interested in Ham Radio?
2. Why do young people want to be hams?
3. Are you more interested in building radio equipment or using them?
4. Are their ham clubs for young hams?
5. What would young hams want to see more in ham radio?
6. Do you think, as a young ham, that you are well represented in ham clubs, the FCC, ARRL, ect..?
7. What do you talk about with the adults on the air?
8. Is the testing requirements easier or harder for you? What do you want to see in these tests?
9. How do you think ham radio is helping you in everyday life?
10. If you have parents who are not in the hobby, are they supportive?
11. What aspect of ham radio are you interested in (voice, FM, AM, SSB, HF, VHF, UHF, ATV, Packet, Fax, DX, Contest, Special Events, biking/hiking ect...)?

If you happen to know of a young ham in your area and reading this message yourself, please copy down the questions and ask him or her to answer it. Thank you very much for all of your support.

Final Note: Edition 007 delay
Due to technical difficulties, Youthnet NEWS edition 007 will not be sent this week. If you have any interesting stories about Fox hunting (for example: first time hunting, or an interesting hunt), send me your stories to my E-mail addresses or Packet address
and I'll include it in edition 007 all due on Sunday, August 7, 1994.
By the way, I hope to see you at the International Packet

Youth Forum (send me a message for more details) Mondays at 0100 UTC on AMPRNet channel 14. The International Packet Youth Forum (IPYF) is a place where young hams meet and just talk (or type) from all over the world (this is an equal opportunity net).

The 3-Hr Ap Indices for 26 JUL 94 are: 11 39 6 6 5 7 8 14
Greater than 2 MeV Electron Fluence for 27 JUL is: 7.2E+06

SYNOPSIS OF ACTIVITY

Solar activity was very low.

Solar activity forecast: solar activity is expected to be
very low.

STD: An eruptive prominence was observed near S36 on the
west limb between 06:52 and 07:19 UTC.

The geomagnetic field was quiet for most of the past 24
hours. An active to minor storm period occurred at many

stations from 27/0300-0600Z.

Geophysical activity forecast: the geomagnetic field is
expected to be quiet to unsettled.

Event probabilities 28 jul-30 jul

Class M 01/01/01
Class X 01/01/01
Proton 01/01/01
PCAF Green

Geomagnetic activity probabilities 28 jul-30 jul

A. Middle Latitudes
Active 20/20/20
Minor Storm 10/10/10
Major-Severe Storm 05/05/05

B. High Latitudes
Active 25/25/25
Minor Storm 10/10/10
Major-Severe Storm 05/05/05

HF propagation conditions were normal over all regions.
A few high-latitude stations may have seen a brief period of
minor signal degradation coincident with the period of minor
geomagnetic storming between 03:00 and 06:00 UTC. Near-normal
propagation will continue over the next 3 days inclusive.

: - rob -
I can't give you the schedule for the Boulder Amateur Radio Club, but
I think they test fairly often. Listen to the BARC repeater at 146.700
and talk to Elly (N0QCX) and she can tell you.

If you're willing to drive up the road to Longmont, the Longmont club
tests on the last Saturday of every month in the clubhouse on the
Boulder County Fairgrounds, I think at 9:00 or 10:00 AM. The LARC
repeater is 147.270 and someone can probably give you the time for sure.

Good luck,
Jim

Yeah... Why is it we just can't seem to get our fathers to get their license?
I, too, have been trying for a few years now and all he can seem to do is point
out how much the initial startup costs might be. Of course, he has an
expensive CB and base antenna, lots of photography, prospecting, hunting,
camping, diving equipment... Maybe he just doesn't have time. :-)

2211. IPS Daily Report - 08 August 94

Newsgroup: rec.radio.amateur.misc
Date: 1994-08-08 23:43:26 UTC
From: rwc@flare.syd.ips.oz.au
Message-ID: <1994Aug8.234326.16552@ips.oz.au>
Source record: 262066
Cross-posted to: aus.radio,ips.solar.activity,rec.radio.amateur.misc,rec.radio.info

SUBJ: IPS DAILY SOLAR AND GEOPHYSICAL REPORT
ISSUED AT 08/2330Z AUGUST 1994 BY IPS RADIO AND SPACE SERVICES
FROM THE REGIONAL WARNING CENTRE (RWC), SYDNEY.
SUMMARY FOR 08 AUGUST AND FORECAST FOR 09 AUGUST - 11 AUGUST

1A. SOLAR SUMMARY
Activity: very low

Flares: none.

Observed 10.7 cm flux/Equivalent Sunspot Number : 74/11

GOES satellite data for 07 Aug
Daily Proton Fluence >1 MeV: 9.0E+05
Daily Proton Fluence >10 MeV: 1.4E+04
Daily Electron Fluence >2 MeV: 6.1E+06
X-ray background: A1.9
Fluence (flux accumulation over 24hrs)/ cm2-ster-day.

1B. SOLAR FORECAST
09 Aug 10 Aug 11 Aug
Activity Very low Very low Very low
Fadeouts None expected None expected None expected

Forecast 10.7 cm flux/Equivalent Sunspot Number for 09 Aug: 75/13

2A. MAGNETIC SUMMARY
Geomagnetic field at Learmonth: mostly quiet.

Estimated Indices : A K Observed A Index 07 Aug
Learmonth 6 3221 1212
Fredericksburg 1 4
Planetary 3 3

Observed Kp for 07 Aug: 0010 1111

2B. MAGNETIC FORECAST
DATE Ap CONDITIONS
09 Aug 5 Quiet
10 Aug 25 Unsettled to active, with isolated minor storm levels
possible.
11 Aug 25 Unsettled to active, with isolated minor storm levels
possible.

COMMENT: IPS Geomagnetic Warning 2 was issued on 7 August and is
current for interval 10-12 August.

3A. GLOBAL HF PROPAGATION SUMMARY
LATITUDE BAND
DATE LOW MIDDLE HIGH
08 Aug normal normal normal
PCA Event : None.

3B. GLOBAL HF PROPAGATION FORECAST
LATITUDE BAND
DATE LOW MIDDLE HIGH
09 Aug normal normal normal
10 Aug normal fair poor-fair
11 Aug normal fair poor-fair

4A. AUSTRALIAN REGION IONOSPHERIC SUMMARY
Observed
DATE T-index MUFs at Sydney
08 Aug 27 Near predicted monthly values, apart from
enhancements of 20-50% from 17-20UT.

Predicted Monthly T-index for August: 20

4B. AUSTRALIAN REGION IONOSPHERIC FORECAST
DATE T-index MUFs
09 Aug 25 Near predicted monthly values, with enhancements of
30-50% leading up to local dawn.
10 Aug 30 As for 09 Aug.
11 Aug 30 As for 09 Aug.

COMMENT: Local propagation conditions may be degraded in association
with geomagnetic activity from 10-12 August. MUFs are not expected to
be significantly affected.

: mconner@rain.atms.purdue.edu the author.

I don't have experience with such small gelcells, but the big ones can be taken down to zero volts repeatedly with little damage (this is one big difference between them and a regular acid cell). But, I still did not let mine go below 10.5 volts (old habits die hard). As for charge, the critical thing is that the charge voltage not be allowed to go above 14.4 volts. Some chargers with poor or no regulation are designed for regular cells and will go above this voltage (as the current drops, the voltage increases). I did ruin one cell like this after I bought a so-called regulated charger. I opened up the charger and found NO REGULATOR of any sort! So much for truth in advertizing by Can**ian T**e. After much arguing, they came good for part of the damage.

Hope this helps.

OK Guy Elementry Electronics: You cars engine is the most unshielded electrical device in the vehicle. It does not interfer with the cars electronics.

The next time you folks get stopped by our nations finest look at the car that stopped you. VHF (155 mhz) UHF (800 mhz), computers under the hood and in the passenger compartment. Light bar on the roof (hell my light bar interefered with my two meter rig before I fixed the light bar), Flashing head lights.

If your still coherent enough after you get into a wreck or have a heart attack worrying about car warantees, check out the ambulance that arrived. Five times as meny lights as the police car and an small repeater on board to boot.

Before you say it. THERE IS NO SPECIAL EQUIPMENT ON AND AMBULANCE TO PREVENT RFI. Unless a cop, firefighter or paramedic is a ham or Cb'er they don'y even know what RFI is.

Any car manufacture that tells you radio will void the warrantee is full of fecal matter. If GM a GM dealer tell you this drag his fat arse down to the local police station and ask him to explain that warantee again.

As for the guy who was out 1200 dollars because his engine happen to blow at the same time as he transmitted - Ask him to get that policy and writing and then hand it to his lawyer. My lawyer called me earlier today and ask me to read this thread. I assure you he enjoyed the laugh.

If the dealer you go to tell you the warantee will be voided, tell him to kiss you arse as you leave his business.

2220. Need some help with the design of an Operational Amplifier

Newsgroup: rec.radio.amateur.misc
Date: 1994-08-09 05:17:46 UTC
From: christos@kuhub.cc.ukans.edu
Message-ID: <1994Aug9.001746.70245@kuhub.cc.ukans.edu>
Source record: 262077

hello there,

I have a question concerning design of a simple amplifier using
operational amplifiers. I am simply designing a noninverting amplifier with a
gain of 2, that is R1=R2 (Closed Loop Gain=(1+R2/R1)). No matter what I apply
to the input of the amp the output always saturates to -11 Volts. Even if no
input is applied the output still gives a -11V.
The voltages that I am applying to the Vcc+ and Vcc- of the op amp are +12V and
-12V respectively. I am using the LM 741 opamp for this application.

Does anybody in this group happen to know what the problem might be?

I would appreciate any relevant response.

Please e-mail.

Thanks in advance

Chris

2221. Re: Help! How to Improve my CW Speed?

From: mswmod@nimbus.sage.unr.edu
Message-ID: <Cu99LG.11p@news.unr.edu>
Source record: 261978

I think the real key is to just do a lot of cw. Get to
where it is just like any other way of talking to someone.
I don't like/use phone so it's been easy for me to do that.
You might try putting a little rig in the car to listen to
while driving. I run a MFJ 9040 mobile. Too busy driving to
write things down so you have to learn to copy in your head.

My problem was that I had learned to copy above 30wpm using
a mill. Never knew what was being sent. Could and did read
books while coping cw. Then I went back to hamming and found
that I could no longer copy in my head!

But just keep at it and above all be sure you have fun. Then
one day you will relize that you are faster than you thought.

2222. Inputs on Hallicrafters SR-2000 xvcr needed

Newsgroup: rec.radio.amateur.misc
Date: 1994-08-09 10:00:14 UTC
From: RSUMPERL@JAGUAR.ESS.HARRIS.COM
Message-ID: <Cu9IGF.82q@jabba.ess.harris.com>
Source record: 261981

Good morning to all...
If you have owned or used a Hallicrafters SR-2000 xcvr, I'd like to hear your impressions of this rig. I can purchase one from an estate sale for a reasonable amount and would like to get some facts on this unit.

Thanks,
Ray

2223. Digest of Articles - QST Jul 94 (Long - 49k)

Newsgroup: rec.radio.amateur.misc
Date: 1994-08-09 10:14:31 UTC
From: wvanho@infinet.com
Message-ID: <327ku7$6s7@rigel.infinet.com>
Source record: 261982
Cross-posted to: rec.radio.amateur.misc,rec.radio.info

DIGEST OF ARTICLES - QST July, 1994

Following are digests of articles printed in the July, 1994 issue of QST. Such digests are being prepared for each issue of QST, and posted periodically.

It is hoped that other hams will volunteer to post similar digests of the other ham technical publications such as QEX, CQ, 73, COMMUNICATIONS QUARTERLY, RTTY JOURNAL, et al. Especially desirable would be digests of publications in other countries, such as the RSGB RADIO COMMUNICATIONS and ham magazines in Europe, Japan, Australia, and other countries around the world. We English speakers would especially enjoy them if they were translated into our language, but they would also be valuable additions to the world's knowledge if they were posted in the language of origin. Who knows? Some bi-lingual ham somewhere might translate them into English and re-post them.

Worldwide communications are getting better and better. The time has come to make the world's ham press available to all hams throughout the world!

The major value of digests is to give readers sufficient information to decide whether to obtain a copy of the full text. If any U.S. reader wants a copy of an article in QST, please inquire of other hams in your own neighborhood. Many have collections of back issues. Anyone who is unsuccessful in finding a fellow ham with a collection should try every library in the area, especially those at universities and technical colleges. If all else fails, a copy can be obtained from the ARRL Technical Department, 225 Main St., Newington, CT 06111-1494 USA for a fee of $3.00 per copy. Remember, it is both cheaper and quicker to obtain one locally.

Readers in most other countries can obtain copies from their own national ham organizations, sometimes translated into their own languages.

TECHNICAL ARTICLES (TA)

Title>TA1:An SWR Detector Audio Adapter
Author>Spencer, Ben C. - G4YNM
Source>QST Jul 94, pp. 24-25
Abstract>Construction of a two-channel audible indicator that generates tones proportional to unknown d.c. voltages; designed primarily for use by blind hams to indicate forward and reverse power in SWR meters.

Digest>This construction project is the building of a dual voltage-controlled audio oscillator, the output of which is two audible tones with frequencies proportional to two d.c. voltages. It is designed primarily for use by blind hams to indicate the outputs of an SWR detector, one channel for forward- and the other for reverse-power. It could be adapted to many other applications to indicate the approximate measure of d.c. voltages, in whatever use.

A circuit diagram and parts list is included. The circuit is simple; it requires only three inexpensive ICs and a handful of electronic components. The two unknown voltages are amplified by half of a dual op-amp IC, the amplified voltages feed voltage-controlled oscillators which are the halves of a dual chip, and each audio output is amplified by an op-amp that is the other side of the dual op-amp chip previously described. The audio outputs go to the two sides of a stereo headphone jack. Power requirements are a nominal 5-volts which can be supplied by batteries, or other source.

The assembled circuit is so small that it will fit inside most SWR detectors. A single-sided PC-board is available from FAR Circuits, 18N640 Field Ct, Dundee, IL 60118-9269 for the price of $4.00, including domestic shipping. A PC-board template package is available from the ARRL Technical Department for an SASE. Address the request for the Spencer Audible SWR Adapter template to Technical Department Secretary, ARRL 225 Main St., Newington, CT 06111.

Title>TA2:A Pocket-Size, Talking Morse Code Practice Computer
Author>Staton, Ken - KD6LHB
Source>QST Jul 94, pp. 26-28
Abstract>Building a portable code practice generator to produce random audible morse signals.

Digest>This is a construction article for a random code generator that produces morse code made up of random letters or letter groups at controllable speed. The finished unit is small, light weight, and can be taken anywhere to provide code practice anytime a few free minutes are available.

It is actually a special-purpose computer using an 8031 microcontroller as its central processing unit (CPU). The software is self-contained, on a read-only memory chip (ROM). The only external control is a single push-button; the operator pushes it and the unit speaks a character in return. The characters form a verbal menu as follows: G,R,S,T,5,1,2,X. Releasing the switch during or immediately after the voiced character selects that option. The options are:
G = 5-character groups
R = random characters
S = sequential characters
T = toggle speech on/off
5 = Farnsworth 5-wpm (character rate: 16-wpm)
1 = Farnsworth 13-wpm (character rate: 18-wpm)
2 = Farnsworth 20-wpm (character rate: 23-wpm)
X = Exit with no change of mode
To shut off the unit completely, one removes the headphone plug from its jack. The code practice computer generates random letters and, when in the speech mode, speaks the letter immediately after it is sent.

Construction is straightforward. It uses four logic chips, including the CPU, a digital-to-analog converter, and E-Prom read-only memory, and a generic logic chip. In addition, it includes two analog chips: a dual audio amplifier and a voltage-regulator. Power is provided by an integral 9-volt battery.

Partial or complete kits are available from the Staton Company, Box 2601, El Granada, CA 94018. The complete kit, excluding only battery and enclosure, is $67.00, including shipping in North America. A PC-board template package is available from the ARRL Technical Department Secretary, 225 Main St., Newington, CT 06111. Ask for the Staton Code-Practice Computer template.

Title>TA3:The Null Steerer Revisited
Author>Michaels, Charles J. - W7XC
Source>QST Jul 94, pp. 29-33
Abstract>Using phased primary and secondary antennas to null interference during reception.

Digest>Null steering is a method of using a secondary antenna spaced some distance from the main station antenna and combining the signals received from the two phased in such a way as to suppress an interfering signal. The interference can be QRM or broadband noise from different kinds of electrical sources. The technique works best in suppressing interference from local sources. It is less effective on QRM from greater distances. For skywave signals, it is almost entirely ineffective.

Mr. Michaels has developed an effective unit which is compact and easy to build. He finds that it wirjs very well, especially on the 40-, 80-, and 160-meter bands. He reports that he can put a 50-dB. null on a nearby KW CW signal and that his Null Steerer is more valuable than all the QRM and QRN suppressing features of his modern transceiver.

The unit uses internal phasing lines made of coils wound on toroidal forms and resisters, along with an adjustable gain amplifier to balance the amplitude of the cancelling signal.

The author built a 5-band model containing a 5-position, 5-pole rotary switch for band switching. It covers all 9 bands from 160- to 10-meters. The 10-, 12-, 15-, and 17-meter bands are covered by one filter, the next covers 20- and 30-meters, and the other filters cover 40-, 80-, and 160-meters respectively. He also points out that a single band model, simpler and less expensive, can be built.

Schematic diagrams and parts lists are included for the amplifier alone, as well as for the overall system. The amplifier is an untuned, broad band unit using two monolithic microwave integrated circuits (MMICs) that provides a nominal gain of up to 40-dB. A PC-board for the amplifier, only, is available from FAR Circuits, 18N640 Field Court, Dundee, IL 60118-9269 for a price of $5.50, including domestic shipping. Also a PCB template package is available from the ARRL Technical Department Secretary. Ask for the Michaels Null Steerer template.

Title>TA4:144-MHz. Sporadic-E
Author>Pocock, Emil - W3EP
Source>QST Jul 94, pp. 37-41
Abstract>A statistical study of Sporadic-E propagation openings on 2-meters analyzed by season, time of day, and region.

Digest>Emil Pocock, the conductor of the monthly column THE WORLD ABOVE 50-MHz, has made a study of sporadic-E propagation as it appears on the 144-MHz. band. Sporadic-E contacts occur most commonly on 6-meters, but are often reported on 10- and 2-meters, as well. They are most common in May through August of each year, but occasionally occur in all months.

It is clear that the effect occurs because of temporary ionized clouds that appear in the E-layer about 100-km. (60-miles) above the earth and reflect VHF signals extremely efficiently. Contacts, when they occur, are frequently very strong and relatively noise-free.

To obtain data from US amateur operations, the author gathered published reports of 2-meter occurrences found in QST and in six VHF newsletters from 1976 through 1993, and also consulted some 24 logs of stations operated by hams very active on VHF. The records included reports of thousands of sporadic-E contacts, most over distances between 1000- and 2500-kilometers (600- to 1500-miles).

Additionally, European sources provided much useful data. The English publication, VHF-UHF DXer, published records covering openings in the May-August seasons from 1977 to 1992. Relevant data were also collected from non-amateur sources. Included were records concerning sporadic-E propagation on 50- and 88-MHz. from a Texas source.

After compiling the data and eliminating records of contacts that might not have been via sporadic-E, he ended with 209 specific openings on 161

different dates. The article is an analysis of those data points.

When graphs were plotted of contacts made over the 14-year period, and compared with a plot of solar flux, it appeared that sporadic-E occurrences peak during the rising portion and falling portion of the sunspot cycle, more frequently than at either the peak or the trough. Consequently, there seems to be a 5- or 6-year cycle, although it has only been observed for one of those "cycles", hence must be considered a preliminary hypothesis to be tested in the future.

In more than 90-percent of all 2-meter openings in the USA, the centers of the path between the stations have been located within one of four areas. He has classified these as Areas A, B, C, and D. A is Colorado and New Mexico; B is Kansas, Missouri, and Oklahoma; C extends from Ohio and Indiana to the Florida panhandle and the Alabama-Mississippi Gulf coast; D covers from West Virginia to South Carolina, between the coast and the Appalachians. No doubt the most important factor determining this distribution is the population of active amateurs. But, in addition, there is probably a real effect that tends to promote the conditions in the upper atmosphere over those areas that make it favorable for E-layer ionization.

One conclusion that the author reached is that, without doubt, there are a great number of sporadic-E openings that occur without being discovered. Active hams would do well to pay attention to conditions on the FM broadcast band or the VHF television band, looking for indications of distant stations appearing in enhanced strength, and otherwise monitoring band conditions, especially during the "off season" when most operators are discouraged from even listening. They may receive some very pleasant surprises!

Title>TA5:Key Components of Modern Receiver Design - Part 3
Author>Rohde, Dr. Ulrich L. - KA2WEU
Source>QST Jul 94, pp. 42-45
Abstract>Comparison tests between current amateur receiver performance and that of receivers built, or modified, in accordance with principles described in earlier installments.

Digest>In this final installment, Dr. Rohde summarizes his discussion of modern optimum circuit elements for modern HF receivers by describing the performance of late models of popular amateur transceivers, and how far from optimum it is. His point is that, with little or no increase in component cost, substantial improvements could be made, and no doubt will be.

He describes a visit to Munich, Germany, where he put a short antenna out the window of his 19th floor hotel room and listened to a Kenwood TS-450S on the 40-meter band soon after sunset. In scanning the entire band he heard nothing but noise, the S-Meter never dropped below S-9, and he did not recognize a single amateur signal. When he switched to 20-meters, he found several "ghost" broadcast stations, that is signals

that apparently carry two different voice modulations. When he switched in 20-dB. of attenuation, the ghosts disappeared completely. This poor performance on both bands was the result of second-order intermodulation distortion (IMD).

In Part 2, he indicated that replacing the switching diodes in the front-end filter section with PIN diodes would make substantial improvement. To prove the point, he obtained a Yaesu FT-890, a Kenwood TS-50, and an ICOM IC-765, all with PIN diode modifications. With that modification, and certain other ones outlined in the previous installments, he found that all three receivers showed drastically improved performance under crowded band conditions.

Finally, he made measurements on a current state-of-the-art, professional transceiver which sells in the $18,000 range. With this, he established the best performance that can now be obtained when cost is no object. The comparison showed that making inexpensive modifications to the current top-line transceivers can improve their strong signal and AGC performance nearly to the level of the most expensive equipment available.

In a side-bar with the article, Mark Wilson - AA2Z, the Editor of QST, announced that, from now on, QST Product Reviews will include the results of second-order IMD testing along with third-order. No longer will these deficiencies be swept under the rug!

PRODUCT REVIEW (PR)

Title>PR1:ETP Alpha 89 Linear Power Amplifier
Author>Sumner, David - K1ZZ
Source>QST Jul 94, p. 76-77
Abstract>Evaluation of a top quality, conservatively designed amplifier.

Digest>The ETO Alpha 89 is one of the few commercial amplifiers that is rated for full legal power output under all operating modes and conditions on the HF bands. It is big, heavy, and conservatively designed.

The amplifier is not highly automated, and cannot be operated remotely by computer control. It still requires the operator to turn knobs in tuning it to frequency! However, it does the next best thing. It has an elaborate operation analysis and warning system that automatically flashes lights to indicate any maladjustment and automatically shuts down the power completely if it is so bad as to risk damage to the equipment. Variables that are monitored and which will set off alarms include: total output (alarm over 1500-watts), grid current (yellow above 85-ma. and red above 100 ma.), SWR (yellow above 1.5:1; red, with total shutdown, above 2:1).

Mains power requirement is from 190- to 250-volts a.c., up to 20-amps. The transformer is tapped for 200-, 220-, or 240-volts. There is no provision for operating it with lower line voltage. The power tubes are a pair of 3CX800A7 operated in parallel, grounded grid. A front panel switch, labelled SSB/CW, changes bias to operate Class B, for SSB, or Class C, for CW. Those who are not concerned about excess power dissipation can operate on the SSB position in all modes.

The reviewer found the operation to be "smooth and solid". The worst case spectral display showed the third-order distortion product 42-dB. below peak output, and the fifth-order is 45-dB. down, while operating at 1.5 KW PEP at 14.0 MHz.

The manufacturer's suggested list price is $3495. The apparatus, less tubes, carries a 4-year warranty. The tubes are warranted by the manufacturer separately.

Title>PR2:Radio Shack DSP Communication Noise Reduction System
Author>Kearman, Jim - KR1S
Source>QST Jul 94, pp. 78-79
Abstract>An inexpensive DSP unit. Does well in eliminating heterodynes, but is not very useful for noise-reduction nor general use in CW and SSB.

Digest>Radio Shack is offering a digital signal processor for receivers at a list price of $80. This is substantially lower than that of the popular amateur-radio grade DSP filters, but its performance also falls short of the popular ham models.

Unlike others on the market, this unit comes with a built-in audio amplifier and loudspeaker. It operates from a 12-volt d.c. supply and draws up to 1.0 amp of supply current.

The unit acts as a variable bandwidth audio filter and also contains a tone cancelling algorithm that, quite effectively, removes one or more heterodynes from phone signals received. But the filter bandwidths and lack of adjustability of center frequency make them almost useless in CW operation, and only marginally useful for SSB.

Although there are three filter modes that are stated to provide noise reduction, Radio Shack has admitted that it does not contain a noise-reduction algorithm! The noise reduction that occurs in use is only that which is inherent in the reduced bandwidth provided by the filter.

The unit does do a good job of removing the multiple heterodynes resulting from the proliferation of shortwave broadcasting stations on the 40-meter band during evening hours. It would be very useful for shortwave listeners, and it seems obvious that this is the market that was being targeted when Radio Shack established the operating specifications for the product.

Title>PR33:Willco Electronics ICM-1024 Memory Replacement Board
Author>Kearman, Jim - KR1S
Source>QST Jul 94, p. 79
Abstract>A replacement board that owners can install themselves when the self-contained battery in ICOM models R-71, IC-745, or IC-751/751A fails.

Digest>The ICOM R-71 receiver, the IC-745 or IC-751/751A transceivers use a complex operating system held in volatile memory. It is maintained by a self-contained battery, but when that battery fails, the entire unit stops operating. Until now, the only solution has been to return the unit to ICOM to be equipped with a new battery!

Willco Electronics, owned by Jack Albert - WA9FVP, provides a plug-in circuit board that any ham can install on their own. It is only necessary to remove the bottom cover and replace the original memory board with the ICM-1024.

In installing it in an IC-751/751A, it is also necessary to add a wire jumper and remove a resistor on the new board before making the change.

The ICM-1024 board also contains a lithium battery to support the on-board memory. Owners can change this battery themselves. Doing so requires re-initializing the settings of the board, but it typically is done only once about every five years.

The replacement board also greatly expands the number of memories available in the transceiver. When bought new, there were only 32 in the transceiver. The new board provides up to 1024 memories for anyone who can think of how to use that many!

The ICM-1024 is available from the manufacturer at PO Box 788, New Lenox, IL 60451. Its list price is $150.00.

HINTS AND KINKS (HK)

Title>HK1:Improved Receive Performance for the Kenwood TS-450S/AT Transceiver
Author>DeCoons, David W. - KE2SL
Source>QST Jul 94, p. 80
Abstract>Describes a modification to utilize the antenna tuner in receiving as well as transmitting.

Digest>In many cases in which an antenna tuner is used for transmitting, receive performance might also benefit from its use. Using it, discrimination against adjacent-channel interference and the second-order IMD dynamic range will be improved, as has been explained by Dr. Rohde in his receiver articles in this and the two preceding issues of QST. But most transceivers with built-in antenna tuners use the tuner only while transmitting.

Mr. DeCoons determined a method of modifying his TS-450S/AT so that the tuner is always in the circuit. In this article, he give step-by-step instructions of how to do it. In his description, he uses component numbers, connection numbers, and the like, that are of meaning only to those with a TS-450 manual in front of them.

He reports that he has noticed improvement of as much as 1 to 2 S-units using the tuner. He invites any reader who encounters any problems, or has comments about this modification, to write to him. His address is: 144 Page Ave., Lyndhurst, NJ 07071.

Title>HK2:Silent Full Break-In Transceiver TR Switching for the Alpha 87a
Author>Jeutter, Dean C. - K3GGN
Source>QST Jul 94, pp. 80-81
Abstract>A simple, silent circuit to replace the noisy keying relay in the Kenwood TS-850S transceiver.

Digest>The author uses his TS-850S transceiver to drive an Alpha 87A amplifier, often using CW with full break-in. He found the noise of the transceiver's TR relay to be very annoying. To quiet the sound, he replaced the switching relay with an electronic circuit. In this letter he describes the circuit and the success he has had with it.

He uses a surface-mount dual MOSFET, the Si9955, with a single chip resistor built on a tiny circuit board (5/8" x 1/2", or 16- x 13-mm.) that he stuffs inside the TS-850's "Remote" DIN connector! In the TS-850S, the TR control signal is either 0-volts in "Receive" or +12-volts d.c. in "Transmit". The author uses that voltage as the power supply to the interface. When the it goes positive, the drain-to-source resistance drops to a fraction of one ohm, effectively grounding the TR input of the Alpha 87A and putting it into "Transmit". A piece of small diameter coax is used as the lead to the amplifier TR input. The action is silent and instantaneous.

If tiny construction is not necessary, the circuit could be duplicated using any of many small switching MOSFETS and a conventional 1/4-watt resistor in a small box.

Title>HK3:Try Diversity Reception and Transmission
Author>Weber, Ralph L. - W8TYK
Source>QST Jul 94, p. 81
Abstract>Simulating diversity operation by paralleling two antennas in both receiving and transmitting.

Digest>Diversity reception is commonly used in military and commercial communication links in order to combat fading caused when a single sky-wave signal arrives from slightly different directions and with different polarization. As the different paths fluctuate, the phase of the arriving signals will shift enough to cause alternate constructive and destructive interference. Using two or more antennas physically

separated and/or in different polarization, and feeding each into a separate receiver front end, then combining the audio, often provides significant improvement of readability at a correspondingly greater investment in equipment.

Mr. Weber has tried to approximate the same effect both in receiving and in transmitting by combining two or more antennas into a common feedline, He uses a trap vertical and a 160-meter horizontal loop. Both antennas are matched to 50-ohm coax, so to combine them he paralleled the connectors to provide a 25-ohm load for his tuner to match.

He reports: "It works great!" He is both giving and getting better reports from stations that he works on a regular basis.

Title>HK4:Reduced Frequency Drift During CW Operation with the Ten-Tec Scout
Author>Broadwell, Chuck - W5UXH
Source>QST Jul 94, p. 81
Abstract>Sometimes with high-speed CW the Scout does not correct frequency properly. How to overcome the problem is described.

Digest>The Ten-Tec Scout does not use a digital synthesizer for frequency determination. Instead, it uses an analog VCO, the frequency of which is automatically measured periodically and small corrections made to keep it on frequency. These corrections can only occur during receiving, and sometimes high-speed CW does not allow enough time for proper correction; consequently significant drifts or sudden frequency shifts can occur.

Mr. Broadwell has discovered that, so long as he keys with an external key, not using the internal keyer, he can "fool" the microprocessor so that it "thinks" he is receiving and proceeds to make the frequent adjustments necessary. He describes, step-by-step, the changes that must be made to specific wire numbers, and the like.

He reports that the modification has made a great improvement in his frequency stability. However, he also points out that one cannot use RIT after the modification has been made.

TECHNICAL CORRESPONDENCE (TC)

Title>Subject: MOVs
Author>Sandoz, Jim - N2MPT
Source>QST Jul 94, pp. 82-83
Abstract>MOVs provide protection against voltage surges. They must be used carefully. Ways to use, and not to use, them are outlined.

Digest>Metal oxide varistors (MOVs) are effective devices for protecting against high-voltage surges. But if used wrongly they can, themselves, be exceedingly dangerous.

An MOV is normally attached across the supply voltage of a circuit to be protected; its function is to short out instantly any voltage higher than the rated level that may occur. But they are designed to protect against short spikes, and cannot dissipate much power. If the voltage rises to a high level and continues, the MOV will quickly burn out and may explode, splattering molten metal onto adjacent surfaces.

Mr. Sandoz cautions that the voltage threshold of the protective MOV should always be at least 50-percent higher than the normal level to be expected. After the MOV shorts, if the line voltage remains high, the only protection is in the circuit breaker or fuse in the line. If one should make the mistake of putting an MOV with a 130-volt a.c. rating across a 120-volt line, it would be very likely that a surge of some time duration would actuate the MOV. The degree of protection will depend upon the associated circuitry. If the circuit being protected is electronic, it is conceivable that the small-gauge wiring in the device would limit the line current enough that the fuse would not blow! The result would be a nearly certain meltdown or fire with perhaps disastrous results.

Another misuse that the author worries about occurs when people put MOVs directly across telephone lines, hoping thereby to protect a modem. If a "line cross" should occur (when a power line falls across a telephone line), several hundred volts may come in on the phone line. But the telephone wire is of such fine gauge that perhaps only 0.5 amp of current will flow to ground through the MOV and the internal house wiring, not enough to blow a fuse. But that represents 250-watts if the voltage is 500-volts and within one minute smoke may be rising from locations throughout the house.

The author's advice is to avoid do-it-yourself protection and stay with quality surge-protectors approved by appropriate agencies such as UL. Finally, although protective devices can often be effective in the face of surges induced by distant lightning, nothing will protect against a direct lightning strike on antennas, power lines, or telephone lines nearby. The only protection for equipment in that event is to unplug power lines, telephone lines, and antennas when the equipment is not in use. _____

Title>TC2:North Shadow
Author>McNally, Irvin L. - K6WX
Source>QST Jul 94, p. 83
Abstract>Two ways to determine true north. One uses the sun at noon, the other Polaris.

Digest>Amateurs who are setting up antennas to track satellites have need to determine precisely where north is. Often they use plumb-bobs to sight the North Star (Polaris).

The same rotation of the earth that gives the illusion that the sun moves across the sky from east to west also makes the stars in the northern sky appear to rotate in circles around a point in the sky directly in line with the earth's polar axis, the celestial north pole. Since Polaris is 1-degree away from that, it traces out a 2-degree diameter circle.

It is directly north only when it crosses its "meridian transits", that is when it appears to be directly below or directly above the pole in the sky when seen from the earth. To make use of Polaris and obtain accuracy better than one degree, it is necessary to get data from the NAUTICAL ALMANAC, or SKY AND TELESCOPE magazine, to determine when those transits occur.

An easier way is, perhaps, to use the shadow of a vertical pole or plumb bob at noon, local time. This, however, requires one to take account of the "Equation of Time", because the sun passes local meridian a few minutes earlier or later than noon, local sun time, as the seasons progress. Mr. McNally has written a program in IBM Basic called NSHADOW.BAS to determine the local time of the north shadow for any day of the year. One needs to enter only the precise local longitude, the month, day, and one's local time zone. The program can be downloaded from the ARRL BBS (203) 666-0578, or on Internet, via ftp, to oak.oakland.edu in file: /pub/hamradio/arrl/infoserver/qst.

FEEDBACK (FB)

Title>FB1:"A Calibrated Noise Source for Amateur Radio", QST May 94
Author>Sabin, William - W0IYH
Source>QST Jul 94, p. 83
Abstract>Typographical errors.

Digest>Two typographical errors occur in the article. On page 29, equation 6, there should not be a second "=" sign between the numeral 1 and the "+" sign. On page 40, equation 8, a minus 1 is missing. It should read:
F(DUT) = F(TOT) - (F(NMI)-1))/G(DUT)

Title>FB2:"Small High-Efficiency Loop Antennas", QST Jun 86, pp. 33-36
Author>Hart, Ted - W5QJR
Source>QST Jul 94, p. 83
Abstract>Correction of an error in Equation 2.

Digest>This article has recently been cited by John Belrose' article in QST Nov 93: "An Update on Compact Transmitting Loop Antennas". William J. ("Bill") Orr, VE3CRN points out an error in Equation 2 of the 1986 article, which was mislabeled as "Equation 5". Its correct form is:
R(L) = 9.96 * 10^-4 * (SQRT(F)) * (S/D)

Title>FB3:"Amateur Use of Telescoping Masts", QST May 94, pp. 41-45
Author>Haviland, R. P. - W4MB

Source>QST Jul 94, p. 83
Abstract>Correction of values in Table 1.

Digest>In Table 1, the MAX V LD for sections 2 through 5 are 3395, 2291, 1665, and 1088 lbs., respectively.

NEW HAM COMPANION (NHC)

Title>NHC1:The Doctor is IN
Author>Various
Source>QST Jul 94, p. 66
Abstract>Questions and answers.

Digest>Questions discussed this month include: how to listen to one's own transmitter; the necessity of assuring correct FSK polarity in digital modes; interconnections between Internet and Packet radio; 2-meter interference from adjacent-channel paging services; using a couterpoise to eliminate difficult grounding problems; and use of miscellaneous gutters, fences, or railings as antennas.

Title>NHC2:Understanding Signal Strength
Author>Wilson, George - W1OLP
Source>QST Jul 94, p. 67
Abstract>Explanation of the logarithmic nature of signal strength perception and measurement.

Digest>This is an explanation of the logarithmic nature of signal strength and how it relates to power and S-meter indications. Included is an illustration showing four scales graduated in S-units, power multipliers, and two versions of power in watts.

The original S-units were defined as a doubling of received signal voltage, which represents a quadrupling of power received, thus each change of one S-unit represents a 4:1 change of power. After the S-meter scale reaches S-9, the next graduations are typically "+ 10-dB.", "+ 20-db.", and "+ 30-db." In that area of the scale, each graduation represents a power change of 10:1.

To illustrate the enormity of changes of transmitter power that would be required to move the S-meter of a remote receiver over the full scale, the author has labeled the other two scales in actual transmitted power. One scale starts at S-2 with 0.01-watts. On that basis, to drive it to S-9 would require 160-watts; 10-dB. over S-9 would require 1.6-KW, and to 30-dB. over S-9 would need 160-KW. In another case, if a 50-watt transmitter is only registering S-1 at the remote receiver, to increase the signal to S-9 would require 3.3-million watts!

Title>NHC3:A Modest Multi-Band Antenna
Author>Brogden, Al - K3KMO

Source>QST Jul 94, p. 68
Abstract>Describes a dipole half-inside, half-outside of the house.

Digest>The author describes a multiband dipole that he put up when he recently moved into a new home. He lives in a 3-story apartment building and has access to the attic. The building is more than 50-feet (15-meters) long measured parallel with the gable, and there is a tree more than 75-feet away, in line with the gable. He wanted the dipole to be 135-feet (41.15-meters) long, half on each side of center, so he put the antenna half inside the attic and half outside the house.

He anchored the antenna in the tree with a rope of a proper length to put the center insulator just outside the wall of the building, then ran the rest of the wire through a hole in the attic wall for the full length of the attic inside the roof. He wanted to locate the center insulator immediately outside the wall so that a twin-wire feeder could easily pass through a window into his apartment close by. This meant that he had to fit some 67-feet of wire into the 50-foot long attic, which he did by bending the last 17-feet at right angles inside the attic. The wire ended up about 40-feet (12-meters) above the ground, half inside and half outside the wooden building.

He uses a Kenwood TS-50 with an antenna tuner and gets excellent results on all bands from 80-meters to 10-. He even gets creditable results on 160-meters.

Title>NHC4:A Gain Antenna for 28-MHz.
Author>Beezley, Brian - K6STI
Source>QST Jul 94, p. 70
Abstract>Description of a very simple wire antenna that provides gain.

Digest>Described is a simple antenna for 10-meters that provides a slight gain over a dipole when it is mounted with the top at least 30-feet (9-meters) high. It is a rectangle made of wire; the width is 73-inches (1.85-meters) and the height of the rectangle is 146-inches (3.71-meters). It is fed in the center of the bottom leg with 50-ohm coax.

At the feedpoint, the coax is split apart and the shield braid connected to one end of the wire, the center conductor to the other. Directly below the feedpoint is a choke formed by winding three turns of the coax into a coil, 1-foot (30-cm.) in diameter.

Calculated gain over real earth is 2.1-dBd. No description is made of how the wire is to be supported.

Title>NHC5:Amateur Radio 101
Author>Hughes, Justin - KA1ULT
Source>QST Jul 94, pp. 71-72
Abstract>Operating 2-meters from a college dormitory room.

Digest>Mr. Hughes is a student at North Adams State College in Massachusetts, living in a dormitory. In his room, he keeps a 2-meter station, using an indoor sleeve dipole that allows him to access a nearby repeater. With this setup, he is able to keep in contact with his parents and friends all over western Massachusetts.

Title>NHC6:Such a Deal!
Author>Ford, Steve - WB8IMY
Source>QST Jul 94, pp. 73-74
Abstract>Advice on maximizing sales in fleamarkets.

Digest>Hamfest fleamarkets are a fixture in ham radio and are sources of pleasure and profit for a great many amateurs. In this article, Mr. Ford gives some advice for how sellers can maximize their sales and, presumably, their profits. He advises vendors to arrive early; to set up displays before the crowd arrives; that equipment should be clean and well displayed; sell ham or computer equipment only; have a chair to sit in but don't sit in it much; be prepared for bad weather; try to have a.c. power available for demonstration; try to get someone to help "mind the store" so that you can get some breaks; be sure to have change in small bills; and don't accept checks except from local buyers. Finally, be sure to obey the local laws regarding taxation.

Title>NHC7:Over the Keyboard Desktop
Author>Leyson, Herbert E. - AA7XP
Source>QST Jul 94, p. 75
Abstract>Building a desktop for a ham operating position.

Digest>Mr. Leyson describes and illustrates with a drawing and photograph a clever arrangement for the working surface of his radio operating table/desk. He operates digital modes and requires a keyboard at his operating position, but also needs a flat writing surface. He realized that the optimum height for a keyboard is several inches lower than that for a writing surface.

To accomodate his requirements while preserving a compact furniture design, he built a working desk with a glass top for the writing surface mounted 3-3/4" (84-mm.) above the wooden furniture top. This allows him to reach under the glass to operate the keyboard while still being able to see the keys. His glass top is made of 1/4" (6-mm.) thick tempered glass, 42" wide (107-cm.) and 16-1/2" deep (42-cm.). He runs a 1" x 2" (25 x 50 mm.) wood brace underneath the glass in the long dimension and also a 1/2" x 1/2" (13 x 13-mm.) strip with a 1/4" x 1/4" (6 x 6-mm.) notch cut out of one corner along the front edge of the glass. He notes that, if half-inch (13-mm.) glass were used, the additional supports would not be necessary.

RADIO TIPS (RT)

Title>The Trusty Slingshot
Author>Ford, Steve - WB8IMY
Source>QST Jul 94, p. 70
Abstract>To get ropes over a top branch in a tall tree, use a slingshot. Put a small fishing sinker on the end of a line, shoot it over the limb, then use it to pull a rope up and over.

GENERAL INTEREST ARTICLES (GI)

Title>GI1:Activating a Rare Island on CW
Author>Western, Roger - G3SXW
Source>QST Jul 94, pp. 19-23
Abstract>A DXpedition to Tristan da Cunha.

Digest>This is a story of a DXpedition to what is, arguably, the most isolated populated land on the face of the earth. But it was not an uncomfortable or dangerous expedition.

The destination was the island of Tristan da Cunha in the south-central Atlantic Ocean. A settled population of British people have lived on the island for several generations, totaling about 300 people, and they live comfortably with most modern conveniences. However, there is no airstrip and only two ships regularly visit the island per year. One stays only 48-hours, but the other brings all yearly supplies each October and stays for three weeks. The author booked passage on that ship; lived with one of the islanders who is, himself, a ham; operated for the three week stay; and returned with the ship to its home port in Capetown, South Africa.

During his stay, he was given the call sign ZD9SXW, operated CW, and operating alone made 23,213 contacts!

Title>Pacemakers, Interference, and Amateur Radio
Author>Weber, M.D., Fred - AA2KI
Source>QST Jul 94, pp. 34-36
Abstract>Describes precautions necessary for amateurs who use pacemakers.

Digest>Dr. Weber prepared this article to answer two questions: (1) Can hams who use pacemakers safely pursue amateur radio? (2) If they can, what safety precautions should they take?

Pacemakers are electronic timing devices that are surgically inserted under the skin and a tiny wire lead passed through a vein into the heart muscle, itself. The electronics detect whether or not the patient's nervous system is generating the proper pulses to cause the heart to pump regularly. If it misses one, the pacemaker supplies the deficiency. But the voltage levels are small, less than 1.0-volt, and the leadwire inside the body is a potential antenna, so interference from external fields is of concern.

The author points out that electronic pacemakers have been used since 1957 and are in very wide use now. Included among the users are substantial numbers of hams who have suffered no problems with them. However, problems have occurred with heavy current and strong magnetic field devices such as electric welders, electric utility substations, and the like. Patients wearing pacemakers must be aware of the potential hazards and take precautions, but it is unlikely that the electric or magnetic fields caused by even high power amateur stations would cause much problem. However, prudence would dictate that one should not expose the body to an indoor antenna running high power, for example, whether or not a pacemaker is in use.

Title>GI3:Ham Radio in the Pacific at the End of WW II
Author>Veregge, E. C. "Bud" - W6PBI
Source>QST Jul 94, pp. 46-47
Abstract>Describes ham operations by a US marine ham in North China in 1945.

Digest>Shortly after the end of World War II, the author was in the U.S. Marine Corps, stationed in northern China. He was one of 16 hams in the area who followed military procedures, were officially assigned callsigns between XU1YA and XU1YZ, and legally began ham activities. But they were greatly outnumbered by GI hams throughout Asia and the western Pacific who had access to military radio gear and put it on the air using callsigns out of their own imagination.

This is the story of how the author set up his station and some of the QSOs that he had with others around half the world.

Title>GI4:Wired for Wireless: Ted Rappaport, N9NB, and His Vision
Author>Cain, James D. - K1TN
Source>QST Jul 94, pp. 48-51
Abstract>Digest>A semi-biographical sketch of N9NB, who is a professor at Virginia Tech, and the amateur activities of several of his friends in the area.

Title>GI5:LARC's Mode-S DXpedition
Author>Kelly, Jim - KK3K and Bledsoe, Don - WB6LYI
Source>QST Jul 94, pp. 52-53
Abstract>Describes a DXpedition to the Caribbean which included 2.4-GHz. operation.

Digest>The Lambda Amateur Radio Club (LARC) is an active, worldwide organization founded 20-years ago for gay and lesbian hams. Among their many activities, they have sponsored three successive yearly OSCAR DXpeditions to Caribbean islands.

In the 1994 trip, they set up on Anguila from March 4 to 10 and included equipment for Mode S (435-MHz. uplink, 2.4 GHz. downlink), the first time from a Caribbean location. Eight or more members participated.

This is the story of their success, and the enjoyment had by all.

Here's a long, but concise reply that will help you properly care for these fine batteries:

The generally accepted way to charge a lead acid battery (gel just means gelled electolyte, BTW) is bring it up to charge using 14.3 vdc until the charge current begins to drop off, then to "float" it at 13.6 VDC.

This float voltage will not overcharge the battery due to its internal resistance.

We usually put a battery discharged to 11.0 volts (full discharge) on 14.3 vdc for .5 hr for each AH of rated capacity, then float it. If the battery gets hot, drop to float voltage immediatly, you'll boil away the electrolyte. They do get warm while recharging initially.

You can recharge them at a "trickle" rate just by using 13.6 vdc as well. After a series of charge/recharge cycles, the cells will discharge unevenly and eventually you'll need to "equalize" the cells with 14.3vdc charging as above.

Lead acid batteries emit hydrogen gas during recharge. Adequate ventilation is required. Discharged batteries should be recharged before storage, and kept in a cool place, on a shelf. Recharge stored batteries every three months, they tend to discharge due to internal cell resistance.

If the terminal voltage reads 13.4 vdc when you remove the charger, its probably charged. Most batteries will drop to 13.0 vdc in the absence of charging voltage pretty quickly. The only accurate way to determine a battery's status is through discharge load testing.

We use two 1157 auto lamps on clip leads for a quick test of a battery's capacity and status. With all four filaments lit, the load is 4 amps, a good test for 4ah to 12ah cells. If you get bright illumination for a couple of minutes, that's a pretty good indication you have

a working battery. Don't buy used gel cells unless you apply this test first.

Anyway, we buy and use small gel cells by the case here (F M Systems is an alarm company) and that's what works for us. Much of our info came from the fine people at Powersonic and Yuasa/Exide. They publish some excellent tech notes on these topics, BTW. The charger schematic in the Powersonic notes is useful for a basic charger design.

Note that Ni Cad batteries are an entirely different chemistry with very different charging and operating characteristics. Don't use this info with Ni Cad batteries, it doesn't work, and you'll damage the cells.

>
>I would like to add one more tidbit of advice.
>
>Sometimes, when I am copying "in the head", it helps to visualize the words
>appearing in front of my eyes. (I have designated this as the
>"Gary Coffman Human Modem Technique" :-)

Thanks, I think. That method doesn't work for me. I understand that some people's imaginations are strongly visual and that they can picture a blackboard in their mind and see the letters appear on it. I can't even visualize the blackboard. Other people claim they see the words floating across their minds. I guess I'm not good at visualization because that doesn't work either. For people who can "picture" things in their heads, it may be a good technique to try.

For the rest of us, there is another way to get letter perfect high speed copy. That's by using a keyboard for copy. Most people have no trouble typing 60 WPM, many are much faster. I do about 120 WPM on the keyboard. This get's around the pencil and paper plateau where you simply can't get the letters down as fast as they are coming in. Press wireless operators, and military intercept operators, are trained to copy this way. In WWII, non-English speakers who didn't even know how to read were trained in this method and copied thousands of messages error free without understanding a single word.

The trick to this method is to simply condition the subconscious to automatically activate the correct finger to hit the right key when the ear hears the letter sound. No conscious input should be allowed to interfere because it just slows the process down. You do this by drill, just the same way you learned to touch type. I have an old friend who was an intercept operator in WWII and a press wireless operator before that. This is the way he was trained to copy, and it's amazing to watch him do it. He can carry on a conversation with you while he's copying and never miss a letter of the incoming message. He actually has to roll the paper up to see what he copied. His conscious mind is totally uncoupled from the process. He says he can copy 60 WPM 5 letter groups for hour after hour with this method.

Now *that's* what I call a real human modem.

I use a different method that works for me. I just scratch down the dots and dashes, using a shorthand stroke format I developed, and sight read the resulting text. I can read that shorthand as easily as I read normal alphabetic text. This is the way Sammy Morse originally did it, except he used a machine to make the marks while I do it by

hand to meet legal requirements for the tests. Of course it isn't terribly fast. In normal operating, I let a machine do it too.

NOTE: The Effective Sunspot Number for 07 AUG 94 was 33.0.
The Full Kp Indices for 07 AUG 94 are: 0+ 0o 1o 0+ 1+ 1o 1o 1+
The 3-Hr Ap Indices for 07 AUG 94 are: 2 1 4 2 5 4 4 5
Greater than 2 MeV Electron Fluence for 08 AUG is: 4.7E+06

SYNOPSIS OF ACTIVITY

Solar activity continued very low. Region 7762 (N05W10),
the sole spotted region, was quiet and stable.

Solar activity forecast: solar activity is expected to be
very low.

The geomagnetic field was quiet.

Geophysical activity forecast: the geomagnetic field is
expected to be quiet for another day. A recurrent disturbance,

likely related to a coronal hole, is due August 10.

Event probabilities 09 aug-11 aug

Class M 01/01/01
Class X 01/01/01
Proton 01/01/01
PCAF Green

Geomagnetic activity probabilities 09 aug-11 aug

A. Middle Latitudes
Active 10/40/40
Minor Storm 05/20/20
Major-Severe Storm 01/10/10

B. High Latitudes
Active 15/50/50
Minor Storm 10/30/30
Major-Severe Storm 01/10/10

HF propagation conditions have remained normal. Normal conditions will continue through 09 August inclusive. On 10 or 11 August, a recurrent disturbance may produce minor signal degradation over the high and polar latitude paths. Some middle latitude night-sector circuits could also be affected on 11 August. Otherwise, near-normal propagation will continue.

EVENTS WITH SWEEPS AND/OR OPTICAL PHENOMENA FOR THE LAST UTC DAY

Date Begin Max End Xray Op Region Locn Sweeps/Optical Observations
------ ---- ---- ---- ---- -- ------ ------ --------------------------
NO EVENTS OBSERVED.

NOTES:
All times are in Universal Time (UT). Characters preceding begin, max,
and end times are defined as: B = Before, U = Uncertain, A = After.
All times associated with x-ray flares (ex. flares which produce
associated x-ray bursts) refer to the begin, max, and end times of the
x-rays. Flares which are not associated with x-ray signatures use the
optical observations to determine the begin, max, and end times.

Acronyms used to identify sweeps and optical phenomena include:

II = Type II Sweep Frequency Event
III = Type III Sweep
IV = Type IV Sweep
V = Type V Sweep
Continuum = Continuum Radio Event
Loop = Loop Prominence System,
Spray = Limb Spray,
Surge = Bright Limb Surge,
EPL = Eruptive Prominence on the Limb.

Well. I do not know.. Last time in here somebody said that
the only way that you can actually communicate via CB band was via
voice. However when I was a little kid I had this small handie talkie
base that operated on the same frequency as CB-14 and guess what else
you could use to talk besides voice? Morse Code! It has a beeping
button that transmitted beeps when you activated the mike!

Oh well. those good ole days of the CB Radio and speaking about 10-200
on the bands (10-200 == the smokey/bear or better known as the police) :).

>I, too, have been trying for a few years now and all he can seem to do is point
>out how much the initial startup costs might be. Of course, he has an
>expensive CB and base antenna, lots of photography, prospecting, hunting,
>camping, diving equipment... Maybe he just doesn't have time. :-)

More likely he's afraid he'll embarrass himself on the test.
My uncle is the same way about lots of new things. He claimed he
didn't have a VCR because they're too expensive. When I bought him
one, he admitted that the real reason was he was afraid he couldn't
learn to program it. I left it with him, and six months later he's
taping, editing, and using that thing in ways *I* haven't figured
out how to do. :-)

The moral is, if you want them to take up amateur radio, you've got
to let them work themselves into it at their own pace and in their
own way. Buy them a radio and hook it up for them. Give them a copy
of "Now You're Talking", and *back off*. With no pressure, they'll
play with it and figure out that they *can* do it.

Nor does it put out 50-100 watts of VHF or HF energy in close proximity to
the ECC. That's a different magnitude and frequency range from that which
the vehicle control electronics are designed to withstand.

>The next time you folks get stopped by our nations finest look at the
>car that stopped you. VHF (155 mhz) UHF (800 mhz), computers under the

>to boot.
>
>Before you say it. THERE IS NO SPECIAL EQUIPMENT ON AND AMBULANCE TO PREVENT
>RFI. Unless a cop, firefighter or paramedic is a ham or Cb'er they don'y even
>know what RFI is.

In fact there *is* special "equipment" on a police car or ambulance to
protect it from these expected RF emissions. Fleet vehicles marketed to
police and public safety agencies are *factory* prepared for this service.
That preparation takes several forms, most not obvious to the eye. The
important thing to know is that these "police package" vehicles are
designed to be sold into this market, and are tested and engineered to
work with the normal communications equipment used in these vehicles.
More mundane vehicles sold to the public generally *aren't* so engineered
or tested by the factories. If you can buy a "police package" auto,
it'll work fine with your electronics. If the vehicle you buy is not
intended for this service, it may or may not work fine.

Honda has *no* fleet sales program at all, and doesn't market to public
safety agencies. The Toyota Camry, the vehicle that seems most prone to
damage from 50-100 watt VHF transmitters, is not marketed to police
either, and the written warrantee disclaims any liability in case you
fit a high power VHF radio in the vehicle.

>Any car manufacture that tells you radio will void the warrantee is full
>of fecal matter. If GM a GM dealer tell you this drag his fat arse down
>to the local police station and ask him to explain that warantee again.

Actually, GM *does* warrant their vehicles for two way radio use. They're the only manufacturer who does that for their full line of vehicles. They also offer factory assistance, and installation guides. They're definitely the good guys in this respect. Some of the dealers, independent businessmen, may not be aware of this unless they do fleet sales, but the zone rep certainly is, and a call to him will straighten the dealer out.

On the other hand, some other manufacturers only warrantee their fleet sales models, designed for service where two way radios will be used, for radio installations. And in some cases, their ordinary passenger vehicles have neither been tested nor engineered to the same standard. If you buy one of their models that they also sell to police, a Ford Crown Victoria for example, then it will be fine. But if you buy something not sold into that market, say an Escort, it may or may not be fine with a powerful VHF signal in the cabin.

>As for the guy who was out 1200 dollars because his engine happen to blow
>at the same time as he transmitted - Ask him to get that policy and writing
>and then hand it to his lawyer. My lawyer called me earlier today and ask
>me to read this thread. I assure you he enjoyed the laugh.

He'd better not laugh too loud. Toyota puts it in writing at the time of the sale that the vehicle warrantee is void if you put two way radio equipment in it. You agreed to that when the sales contract was signed, whether you read the fine print in the warrantee book or not. Ignorance is no excuse under the law. Toyota ECC systems are *not* RFI proofed against high power VHF signals, and *can* blow up if one is present in the cabin with the ECC. And the thing *does* cost $1200 over the parts counter. (That's robbery, of course, but your only alternative is the junk yard.)

Nor can your lawyer friend bring a case based on a general merchantability and fitness implied warrantee because the vehicle is not marketed for carriage of that type of equipment, and you are explictly *warned* not to attempt to do so. (Actually, a lawyer can sue for any reason, or no reason at all, but his chances of winning aren't very good in this particular case unless he gets a Menendez brothers jury.)

>If the dealer you go to tell you the warantee will be voided, tell him to
>kiss you arse as you leave his business.

Now *that* sentiment I agree with. The only way to get more manufacturers to do the necessary engineering and testing is to hurt them in their pocketbooks through lost sales. Be sure to tell them *why* they lost the sale too. Don't just tell the dealer, tell the zone rep too. It *may* do no good, amateurs are a small segment of the auto market, smaller than the public safety fleet market that such manufacturers are *also* ignoring, but it *may* help.

You use the callsign assigned to you for the particular service in
which you are operating. An amateur license gives you no authority to
operate outside the amateur bands, and should not be used outside the
amateur bands. Use your assigned marine callsign on marine radio.

Six years into having a VCR my father still hasn't figured out how to
put a tape in and watch it.

Then again, when my mother goes to visit my relatives in Ohio, she has
to leave him instructions on how to use the microwave to make himself
supper.

2234. Family Amateur Radio Event (F.A.R.E.)

Newsgroup: rec.radio.amateur.misc
Date: 1994-08-09 14:19:44 UTC
From: lenwink@indirect.com
Message-ID: <lenwink.159.000E54A1@indirect.com>
Source record: 262009

The F.A.R.E. is getting closer. It takes place on Ham Awareness Day, Saturday, September 17, 1994, at Rawhide Theme Park, in Scottsdale Arizona. The swapmeet begins at 6:00am and the exhibit hall opens at 9:00am. It is an event for the entire family. From craft exhibits to face painting, from rides to a dunk tank with ARRL officials, from Ronald McDonald to "hands on" operating stations, from ATV to Packet to HF voice & CW, from an operating MARS station to an operating AMSAT station, to an event station using Barry Goldwater's K7UGA callsign, to seminars on Weather Satellites, getting into packet, AMSAT, ATV, to the History of Radio with Walkie-Talkie INVENTOR, Al Gross, W8PAL, it will be a fun time for all. Commercial exhibit spaces still available as are swap meet tailgate spaces. Raffle prizes, as well as door prizes, are being given away. Don't miss this year's FARE.
e'mail for more info.

For the month of August, Radio Devices is offering the
following CD-ROMs for special prices:

1) Summer 94 Edition QRZ! from Walnut Creek for $21.95.
2) Buckmaster HamCall for $41.95
3) Buckmaster Electronic Software Compendium for $24.95.
4) Buckmaster Firearms and Shooting Sports Compendium for $41.95.

All prices include USPS shipping. No "handling" charges ever.
COD is available for $5 extra.

Send check or MO to:
Radio Devices
32 Queens View Road
Marlboro, MA 01752

To keep the lowest prices, I cannot accept credit cards. SRI.

I'm interested in purchasing a short wave radio (I think), but I know NOTHING about them. In fact I don't know what the differences are between a short wave, ham, and scanner. (please enlighten me) I've been looking for a decent faq that could explain the basics, but to no avail. (I've searched about 10 different news groups)

Could a kind soul please tell me what group I should direct my plea and perhaps answer a few of my basic questions? In what price range are the decent ones? (I hate junk, but I don't want the top of the line model either)

Please email as I don't read (or understand) the conversations on this news group.

Thanks,
Hal

I participated in a part of the 10-10 contest last weekend and found it to be exciting, not just in the contest but also ragchewing with the others.

I was able to make 6 states and 2 countries on 10 meters (not very good I admit but time was a limiting factor).

I would like to join the 10-10 club. I need to send my 10-10 log to the area 4 coordinator but don't know who it is. I would appreciate any other into that you might have to pass along as well.

>
>Gary

Actually, there is now an official Tech Plus license being generated by
the FCC, so that's no longer a special case.

Regardless, there is NO reason to delay taking any tests, and you should
NEVER need to check the "application already in the works" box on the form
610 unless you have directly sent a form to the FCC (change of address
or renewal, for example). The VEC will take care of holding the paperwork
for subsequent upgrades and will work with you (they need a copy of the
paperwork you get from the FCC -- your license with the upgrades to date shown)
to process the subsequent upgrade.

By all means go and take tests when you are ready, and sign /AG or /AA or
/AE as required and enjoy getting on the air. No reason to delay operating
just because some paperwork might take a few months to get completed...

2241. Which code learning method? Why?

Newsgroup: rec.radio.amateur.misc
Date: 1994-08-09 15:00:16 UTC
From: djenkins@jetson.uh.edu
Message-ID: <3285m0$lj7@masala.cc.uh.edu>
Source record: 261990

I took my Technician written tests Saturday (passed--yay!), but seeing all those guys with their tricky gear made me say to myself, "Dave, if you want to play with the big boys, you'll have to *act* like a big boy!" And so I've decided to go ahead and learn code. I have the diskette I got from ARRL with Morse Tutor on it, so I broke it out this weekend and fired it up. I selected the Farnsworth option, initially with character speed set to 13 and word speed set to 6. My reasoning was, that I'd start with an initial speed significantly greater than that required for the 5 wpm test, and just see how it went--I could always drop back to a slower speed if I was getting bogged down.

I'd worked through about three of the lessons, and I didn't think I was having much difficulty, so I decided to see how much easier a slower speed might be. When I changed speed to 6/6, everything sounded like gibberish, and I couldn't keep up at all. What's going on here? When I changed back to 6/13, all was well once again. My theory is that the faster character speed is giving me more dead air time between characters to figure out the character, and that dead time is absent when the word and character speeds are equal--what do you all think?

Anyway, here are my questions: should I continue with Farnsworth method? If so, what are the recommended speeds for initial learning? Is there any difference between 5 wpm "standard" and Farnsworth set to 5/5? And finally, if there *is* a difference, when I take the 5 wpm test, will that be the same sound as the "standard" or Farnsworth 5 wpm offered by the Morse Tutor program?

Oh, and one last thing: are there better PC Morse learning programs than Morse Tutor? If so, can you give me titles and possible sources? Thanks for your help and advice. I really want ot learn code, but like everyone else, I want to make the process as painless as possible.

This weekend during a search & rescue exercise we were using 2m simplex for base-to-team communications, and had some problems with teams behind hills and in low spots. Next time we'd like to set up a mobile crossband repeater at a high spot, but there's been lots of talk lately about the legality of using crossband repeating rigs that don't ID themselves. Someone mentioned that some of the new dual-band rigs had auto ID features on them, but I haven't noticed any mention of this in any advertising I've seen. Which, if any, rigs now have this feature? And what's the price range on these rigs?

That's a good idea, but you may want to go even faster before taking
the test. Say 7 or 8 wpm. (Possibly even faster...) This gives you
more of a cushion. I know I always seemed to copy slower during the
tests.

>My theory is that the
>faster character speed is giving me more dead air time between characters to
>figure out the character, and that dead time is absent when the word and
>character speeds are equal--what do you all think?

That's probably it. At least, the space between characters is proportional
to the dits and dahs.

>Anyway, here are my questions: should I continue with Farnsworth method?
>If so, what are the recommended speeds for initial learning? Is there any
>difference between 5 wpm "standard" and Farnsworth set to 5/5? And

The Farnsworth method is used by the ARRL/VEC on its tests, so you
should at least try it before taking the tests. (I don't know if
anyone uses the regular method, but you should listen to it, too,
just in case...) I *think* they send the characters at 18 wpm for
both the slower tests, but the 5wpm test could be 5/13. (And, yes,
I believe 5 wpm standard is the same as 5/5 Farnsworth.)

>Oh, and one last thing: are there better PC Morse learning programs than
>Morse Tutor? If so, can you give me titles and possible sources? Thanks for
>your help and advice. I really want ot learn code, but like everyone else, I

Personally, I like Super Morse. (Some people don't like the way it
teaches you the characters...) You can download it from several FTP
sites. The one I am most familiar with is OAK.OAKLAND.EDU, and the
file is /SimTel/msdos/hamradio/sm410.zip.

You are operating on 2 DIFFERENT services... each have their own licensing requirements and their own callsigns. Use your Amateur Radio call on the ham bands and your Marine license when operating on those frequencies. Using the other callsign on the other band may cause you to loose those privilages... be carefull.

Not meant as a critcism, but you use the callsign of the service that the
radio is licensed in (by frequency) ... marine you use marine, ham you
use ham.

I think you should read the FCC regulations governing ham radio. You
seemed to be missing a basic understanding on how licensing works.

Actually, as of summer 1993, Toyota said (in writing) that it was okay
to put transmitters of up to 100 watts in a Toyota Camry and that the
offending section of the owner's manual has been changed. I don't have
the letter handy anymore, but I sent a copy up to Ed Hare at ARRL.
I hope ARRL still has it! 8^)

Simple, I bet you that the Toyota people don't classify a cellular phone
as a 2-way radio.

That I would love to see. Go buy your new Toyota, put your portable
cellular phone on the front seat and then blow out the computer the
first time you make a phone call. Toyota would never hear the end of it.

: Also, does the RF choke go in series with the ground lead as close as possible
: to the gas tank (I assume)?

Yes, solid electrical bond.

As I understand it, the filter choke would be in power lead to tranceiver.

The filter choke is already addressed in previous Ford service bullitin.
This previous service procedure did not include the "grounding", which
is why I complained thru Mark McIntyre, and got Ford to do a followup.

>1. Since a cellular phone is a two-way radio, I guess people
>who own Toyotas cannot have cell phones in their cars either?

Cell phone electronics are either: a) hand held, very low power or
B) installed, preferably by the dealer, with the electronics in the trunk,
away from the ECUs in the engine and passenger compartments.

>2. What happens to the poor ham operator who carries an HT with him,
>doesn't use it, but accidently parks next to my car and I key up with
>1500 watts?

Then there is no problem on the ht owner's part. There are no electronics
Installed in the car. So if your 1500w blows his engine he could go to the
dealer and have the service department deal.

>MD
>--

Just my 2 bits on this. Especially since I plan on installing 2 way boxes
in my next car.

2256. Infomation about Maryland QSO Party

Newsgroup: rec.radio.amateur.misc
Date: 1994-08-09 17:31:27 UTC
From: jeg@aurora.jhuapl.edu
Message-ID: <jeg.776453487@aurora.jhuapl.edu>
Source record: 262017

Greetings:

Here the information that I have about the Maryland QSO Party
I do not know who to contact on the net with regards to this, it's not
me! Please distribute widely.

"Times and Dates

16:00 Z (12:00 PM) Aug 20 to 04:00 Z (12:00 AM) Aug 21
16:00 Z (12:00 PM) Aug 21 to 23:59 Z (11:59 PM) Aug 21

Awards

Certificate and QSO Party Logo Watch to the high scoring MDC Log and Top
Non-MDC Log !
Certificates awarded for all other categories including: 10
best MDC logs, best each US State, Canadian Province, DX Country, MD Club, DC
Club, MDC Mobile, Best YL Score, best QRP from each state. Best Novice/Tech each
state. A plaque (Donated by Amateur Radio of Hagerstown) will be awarded to
the high scoring MD-DC Club. Participation certificates to all with 40 or
more QSO points.

Rules

Non-MDC Stations must work only MDC stations. MDC stations may work anyone.

Portables and mobiles that change counties during the test count as a
separate station in each new county of operation. No packet or repeater QSOs. QSOs
part of a regularly scheduled net are not allowed.

Exchange: QTH and major category of entry. Major Categories include:
Club, QRP, Mobile, Novice/Tech, and Standard. Stations should send the major
category that reflects their highest point value.

Suggested frequencies:

SSB: 3.92, 7.23, 14.26, 21.37, 28.38, 50.15, 146.55 MHz
CW: 3.643, 3.701, 7.035, 7.126, 14.04, 21.115, 28.04, 28.115 MHz

CW is suggested on the odd half hours. Examples 1730, 1930, 2130, 2330,
0130,
0330Z

Scoring: For Non-MDC stations - Each MD county + Baltimore City + DC are
multipliers (25 possible).

For MDC Stations - Multipliers are MD Counties + Baltimore City + DC + each
of the 49 other states + Canadian Provinces + 1 other DX. Multipliers may be
claimed once only. They do not repeat on other bands.

QSO Points:

Pts Description
10 Club Station QSOs. (Clubs anywhere for MDC Stat.).
05 Mobile QSOs (Mobiles anywhere for MDC Stat.).any other valid
contact (Standard SSB and FM).

Final Score: Add up all QSO points and multiply by the sum of the
multipliers

Send logs with SASE by September 10, 1994 to the Antietam Radio Association,
P.O. Box 52, Hagerstown, MD 21741-0052 Good Luck !"

Pracitce, practice, practice ;-)

Two ideas:

- On a big CW contest weekend, listen to the contesters. Many good contesters hover in the 30-35 wpm range. Find the ones that are CQ'ing - you can hear their exchange several times to be sure you got it right. Of course, you have to keep moving, but it's good practice for call signs, numbers, etc.

- Get a computer program that will send random 5 letter sequences. (The one I use is the N6TR contest logging package, but there are probably others that will do this. Have it send the sequence at whatever speed you want, then have it repeat the sequence to see if you got it right.

Neither of these techniques will help you for copying long strings of text, but they'll do wonders to speed up you short sequence copying.

Cross-posted to: rec.radio.amateur.misc,rec.radio.shortwave,rec.radio.info

ANNOUNCEMENT
Shortwave & Radio Catalog

Shortwave / Radio Hypertext Catalog on the World Wide Web (WWW)

AVAILABLE NOW
ISSUE #9

** NEW: Personal MUF/LUF Propagation Chart Generation
** NEW: Number's Station Info via Mike Chase

A catalog of hypertext links to FTP, GOPHER, and WWW files and services
for the Shortwave Listener and Radio enthusiast is now on-line. This issue
includes links to broadcaster schedules, digital audio files, graphics,
mediumwave, shortwave, FM, Ham Radio, FCC, and other files associated with
radio.

IMPROVED HYPERTEXT FAQS
Ralph Brandi's FAQ material in hypertext form has been upgraded and is NOW
available on this WWW server! In addition, over 100 hypertext links (and still
growing) are listed. These include direct links to Shortwave, AM, and FM
broadcasters, Solar reports and images, Free Radio Berkeley, audio files,
ham radio info and much more. All these available with a click of your mouse
via NCSA's Mosaic (return key for NCSA lynx users).

The URL to put in your hotlist/bookmark file:

http://itre.uncecs.edu/radio/

** MUF/LUF **
Maximum Usable Frequency, E-Cutoff a.k.a. Lowest Usable Frequency Charts

I have a WWW MUF/LUF tool based on "micromuf.bas" on-line! Fill out your
location, transmitter location, and sun-spot info (links to solar info for
the day, week and month available from the web page.) and an ASCII, WWW, or
even a .GIF MUf/LUF propagation chart graphic file will be returned! Try out
this interactive World Wide Web form.

Toward the Future

If you have a site or know of a site that maintains up-to-date information
on radio topics, send me e-mail.

If your club would like to participate, (provide program schedules, club
events, maintain files on individual broadcasters, etc.), send me e-mail.

If you are a radio broadcaster and have internet ftp files, gophers or WWW servers with program schedules, audio-on-demand files, or other information to share, send me e-mail.

I am also looking for UNIX software programs that could create propagation information in graphic form (GIF, JPEG, ???) that would be adapted to use WWW forms to send the graphic to the WWW user. If you know of a tool (read free program), send me e-mail.

My thanks to Jay Novello for providing his public access WWW server and to Ralph Brandi for providing the FAQ html files!

Source record: 262027

David Jenkins (djenkins@jetson.uh.edu) wrote:
: I took my Technician written tests Saturday (passed--yay!),: Anyway, here are my questions: should I continue with Farnsworth method?

Congratulations, see you on the air in a few months.

: If so, what are the recommended speeds for initial learning?

Anything OVER 17wpm. That's the "speed of fluency" (the speed where it sounds like one "word" instead of seperate sounds) for most people.

I had been trying to learn code for almost 30 years. I had tried all sorts of tapes, programs, etc, finaly I found a package called "Code Quick". With Code Quick, I went from barely 3 words a minute, a 30% score on the 5 wpm test to 100% score and over 2 minutes of perfect copy. If the examiners had kept the door closed to the room (I disctract easily), I would have had close to 100%. This took me about 10 weeks of study and practice. My son (aged 12) is copying 100% at 4wpm and doing fairly well (but not 100%) at 6wpm in 6 weeks. He even likes the code.

: Oh, and one last thing: are there better PC Morse learning programs than
: Morse Tutor? If so, can you give me titles and possible sources? Thanks for
: your help and advice. I really want ot learn code, but like everyone else, I
: want to make the process as painless as possible.

There is a program that works with code quick (costs extra), it has helped my son with the learning drills and games and helped me with the random words.

I found that the best way to pick up speed (for me) is to Jerry Ziliak, KB6MT's, high speed code course (farnsworth speed = 20wpm, starts at 3wpm, at 15wpm it switches to a farnsworth speed of 23 wpm) but I was totaly wasting my time until I took the Code Quick course first.

His course is designed to start out with no knowledge, but initialy it did not work for me. For you it may work.

Listening to random words and w1aw bullitens also helps. Listening to QSOs rarley does as many novices send code very sloppily and you become frustrated.

Always spend some time practicing at a word rate higher than what you can copy. For example, if you can copy at 3wpm, spend some time at 5wpm, if you copy at 5, spend time at 7wpm, etc.

Expect to practice at least an hour a day. If you feel that your brain has "fried", or you are stuck, take a break, but spend a total of at

least an hour a day.

73,

Geoff.

-->
-->73 de n1kdo
-->
-->

Unless you are using the new 2 piece N-connectors which have
a center pin sufficient for 9913.

The new 2 piece N connectors have the pin already attached
to the housing. You solder through a hole in the pin to
attach the center conductor to the pin, then solder through
the body holes to connect the shield to the body, like a
standard PL-259.

They are great.

>Hopefully I will pass 13WPM (passed my General written already) and can skip
>this whole mess. But just in case I only do 5 :-(I would like to know.

>Dave KB7QCL

I was a TECHNICIAN when I passed the 5 WPM back in January of this
year. I have received nothing from the FCC. Not surprising since
the VEC (KA9MWT, KB9QL) claimed there were no forms they had to
send in! They said I had to carry this little 5 WPM CSCE and
my "no-code" TECH license around with me for the rest of my life
(or until I pass BOTH the 13 WPM and the GENERAL written).

Apparently, NO forms are sent in until ALL elements required
for the GENERAL are passed.

I just bought (or am in the process of buying) a power supply for my HTX-202. However the power supply is 13.8VDC and 3A. I know the 202 works fine at ~13.5VDC and 2A (car battery). Will the slightly higher voltage and amperage cause a problem? If it is a problem, I should just be able to add a resistor in series to get the amperage down, correct?

Message-ID: <t.grimwood-1008941055030001@130.216.90.102>
Source record: 262024

Thanks again for all the replies to my request for a
postscript Smith chart. I've just queried the Australian
archie server (archie.au), and it came up with this
source:

Host cs.orst.edu

Location: /pub/src/printers/ps
FILE -rw-r--r-- 21198 Jan 15 1991 smith.ps

There are other sites around the world as well, and you
can find them by using archie. This one
I verified by getting the file (caveat FTP-er: not
all smith.ps'es are Smith charts; the genuine article
in raw postscript form is around 21K in size, 11K or
so if it's Zipped).
Now I'm trying to figure out why I didn't use archie
in the first place.

Argh! I've got two brains. One's gotten lost and the
other's gone to look for it! 8~)

> voltage and amperage cause a problem?

The voltage might, but it shouldn't really be a problem. Check the 202's
specs for maximum voltage -- it's probably 14V or more.

The current rating of a power supply is a maximum. Anything less is
generally OK, though some switching supplies specify a minimum load
current as well as a maximum. How do you find out whether your HTX-202
will overload the supply? Easy -- check the specs again. This stuff
is always in the manual somewhere, usually near the beginning or the
end.

For reference, my Heath HW24HT dual-band handheld is rated to operate
on anything from 5.5 to 16V and draws up to 1.3A, depending on the
output power and the band. Your power supply would work with it; in
fact, it can supply enough current for two radios like my Heath.

Oh, one more caveat: Be careful if it is a switching power supply.
Some switching supplies have large ripples at a couple of kilohertz
on their outputs. The result can be a whine in a radio's output. The
only way to see if a particular switching supply works well with a
particular radio is to try it out and request some signal reports.
Linear power supplies don't have this problem.

>and the repeater's been ID'ed.

>To my way o' tinkin', no problem, mon. :{)

This would be legal, if you could get it to repeat both ways. The
common application of xband repeat is this. You have a dual band
mobile and a 440 HT. You want to go fishing. Park car, and set up
mobile to do x-band repeat as follows:

In: 446.0 (for example) Out: 2m repeater's input frequency
In: 2m repeater's output frequency Out: 446.0

OK, so now you have a 440 extender you can take down to the canyon where
the fish are...

If you call out to your 2m repeater saying this is N1ABC, N1ABC repeater,
that covers the first side of the link. But unless you have
people cooperate on the other side, the 2m->440 side doesn't get
ID'd, and that's the problem. You have to convince your
buddies (and all those that aren't talking to you, but are on
the 2m repeater) to ID your mobile for you, every 10 mins there
is activity.

Is this a real problem? Not, unless you are gonna split hairs about
rules. But it IS illegal. The bigger problem with X-band are the
bozos out there that don't know how to pick the right frequencies.
The example given above is somewhat risky, since you are xbanding
onto a repeater input.

Source record: 261933

T> Once I get my ham license from the FCC which call signs do I use when
T>using the marine band VHF on my boat?Should I use the call sign I was
T>issued when I registered the radio or should I use the call sign that the
T>FCC will be sending me for amateur radio use?Thanx in advance.

The former. Use the appropriate call for the frequency you're on. If you
use your ham call on a marine frequency you'll be operating out of band
(i.e., illegally ...), & v.v.

2278. New Mod info for TH-78A

Newsgroup: rec.radio.amateur.misc
Date: 1994-08-10 01:13:32 UTC
From: dwv@synergy.org
Message-ID: <00020B8C.fc@synergy.org>
Source record: 261941

I did some experimenting with my TH-78A micro-HT and here's what I found...

To "open up" the radio completely and provide both extended receive (300+ Mhz, 800-900Mhz) and out of band TX, you need to remove diode D3 and cut the green wire jumper W1. This has already been published.

However, I found out some other interesting stuff...

Cutting W1 by itself completes the Mars/CAP mod only (no extended RX, no out of band TX)
Cutting W2 by itself allows extended receive, but no Mars/CAP or out of band TX
Cutting both, naturally, allows both.

Now, here's where it gets interesting...

If you remove diode D3 with both wires cut, extended RX is no longer possible. To reenable extended RX you need to reconnect W2, which brings us back to the original directions of *cut W1 and remove D3*.

As you can probably figure out, I went through each of these combinations because I wanted to avoid doing micro-surgery to my trusty Kenwood....however, I'm here to confirm the accuracy of the previously published mod docs. If you purchased your radio before July 1992, or so, this information may not apply to you. Contact Kenwood's service center with your serial number in hand to confirm the proper mod technique.

USUAL DISCLAIMERS APPLY HERE...I WON'T TAKE ANY RESPONSIBILITY FOR THE ACCURACY OF THIS INFORMATION. IF YOU FRY YOUR RIG, IT'S YOUR PROBLEM!

>
>I am having difficulty going over 30 WPM. I can copy solid at 25 WPM.

I see a lot of sensible commentary has been made, so I will touch on two
things:

When I was starting to play kid baseball, the kids in my neighborhood used
to play a game called "burnout". Burnout was a simple game of catch, except
that you would throw the ball as hard as you could when tossing the ball
back and forth.

When I was starting to play radio, I had a few kids in my ham neighborhood
that I used to play CW burnout with. We would turn up the keyers as fast
as we could manage to send, and wear each other out. Of course, when you
are a kid you have a lot of time to do this kind of thing, but I found it
paid off. If you have one or two friends who have the time and are at a
similar skill level, this would be something to try.

Secondly, I keep hearing this saying "good CW operators eventually learn
to hear words rather than characters when going at high speeds." This
has never been the case for me, or at least it has never felt this way
in my brain. Perhaps this is why I never advanced beyond 65ish WPM. I
only mention this because I don't think it's necessary to "hear words"
to be a competent CW operator.

NOTE: The Effective Sunspot Number for 08 AUG 94 was 28.0.
The Full Kp Indices for 08 AUG 94 are: 1o 0o 0o 0o 1- 1o 1o 2-
The 3-Hr Ap Indices for 08 AUG 94 are: 4 1 1 1 3 4 4 7
Greater than 2 MeV Electron Fluence for 08 AUG is: 4.2E+06

SYNOPSIS OF ACTIVITY

Solar activity continued at a very low level. There is
one spotted region which showed little evolution. In x-ray
imagery, a small region is visible at the east limb.

Solar activity forecast: solar activity should
continue very low.

The geomagnetic field was mostly quiet but trended toward
unsettled at the end of the period.

Geophysical activity forecast: the geomagnetic field
should be generally active for the next three days due to a
coronal hole related disturbance. Minor storm intervals are
probable during local nighttimes. Occasional major storm
levels are possible at high latitudes.

Event probabilities 10 aug-12 aug

Class M 01/01/01
Class X 01/01/01
Proton 01/01/01
PCAF Green

Geomagnetic activity probabilities 10 aug-12 aug

A. Middle Latitudes
Active 40/40/40
Minor Storm 20/20/20
Major-Severe Storm 10/10/10

B. High Latitudes
Active 50/50/50
Minor Storm 30/30/30
Major-Severe Storm 10/10/10

HF propagation conditions were normal over all regions
today. Conditions are expected to deteriorate slightly over
the next 72 hours, particularly over the high and polar
latitude paths. Minor signal instability with possible periods
of stronger instability will be possible on transauroral
night-crossing circuits through 12 August inclusive.

Gary,

In 20 years of EMS I have spec'd dozens of ambulances. There is nothing in
the chassis that would prevent RFI from reaching the cars computer. The
chassis is with two exceptions the same chassis used in any van. Those two
exceptions are the suspension and the federally required dieasel engine.

Ambulances are not built by the auto manufactures but by refitters and they
do not provide any special shielding.

Pete

: >
: >Before you say it. THERE IS NO SPECIAL EQUIPMENT ON AND AMBULANCE TO PREVENT
: >RFI. Unless a cop, firefighter or paramedic is a ham or Cb'er they don'y even
: >know what RFI is.

: In fact there *is* special "equipment" on a police car or ambulance to
: protect it from these expected RF emissions. Fleet vehicles marketed to
: police and public safety agencies are *factory* prepared for this service.
: That preparation takes several forms, most not obvious to the eye. The
: important thing to know is that these "police package" vehicles are
: designed to be sold into this market, and are tested and engineered to
: work with the normal communications equipment used in these vehicles.
: More mundane vehicles sold to the public generally *aren't* so engineered

: or tested by the factories. If you can buy a "police package" auto,
: it'll work fine with your electronics. If the vehicle you buy is not
: intended for this service, it may or may not work fine.

: Honda has *no* fleet sales program at all, and doesn't market to public
: safety agencies. The Toyota Camry, the vehicle that seems most prone to
: damage from 50-100 watt VHF transmitters, is not marketed to police
: either, and the written warrantee disclaims any liability in case you
: fit a high power VHF radio in the vehicle.

: >Any car manufacture that tells you radio will void the warrantee is full
: >of fecal matter. If GM a GM dealer tell you this drag his fat arse down
: >to the local police station and ask him to explain that warantee again.

: Actually, GM *does* warrant their vehicles for two way radio use. They're
: the only manufacturer who does that for their full line of vehicles. They
: also offer factory assistance, and installation guides. They're definitely
: the good guys in this respect. Some of the dealers, independent businessmen,
: may not be aware of this unless they do fleet sales, but the zone rep
: certainly is, and a call to him will straighten the dealer out.

: On the other hand, some other manufacturers only warrantee their fleet
: sales models, designed for service where two way radios will be used,
: for radio installations. And in some cases, their ordinary passenger
: vehicles have neither been tested nor engineered to the same standard.
: If you buy one of their models that they also sell to police, a Ford
: Crown Victoria for example, then it will be fine. But if you buy something
: not sold into that market, say an Escort, it may or may not be fine with a
: powerful VHF signal in the cabin.

: >As for the guy who was out 1200 dollars because his engine happen to blow
: >at the same time as he transmitted - Ask him to get that policy and writing
: >and then hand it to his lawyer. My lawyer called me earlier today and ask
: >me to read this thread. I assure you he enjoyed the laugh.

: He'd better not laugh too loud. Toyota puts it in writing at the time of
: the sale that the vehicle warrantee is void if you put two way radio
: equipment in it. You agreed to that when the sales contract was signed,
: whether you read the fine print in the warrantee book or not. Ignorance
: is no excuse under the law. Toyota ECC systems are *not* RFI proofed
: against high power VHF signals, and *can* blow up if one is present
: in the cabin with the ECC. And the thing *does* cost $1200 over the
: parts counter. (That's robbery, of course, but your only alternative
: is the junk yard.)

: Nor can your lawyer friend bring a case based on a general merchantability
: and fitness implied warrantee because the vehicle is not marketed for
: carriage of that type of equipment, and you are explictly *warned* not
: to attempt to do so. (Actually, a lawyer can sue for any reason, or no
: reason at all, but his chances of winning aren't very good in this particular
: case unless he gets a Menendez brothers jury.)

: >If the dealer you go to tell you the warantee will be voided, tell him to
: >kiss you arse as you leave his business.

: Now *that* sentiment I agree with. The only way to get more manufacturers
: to do the necessary engineering and testing is to hurt them in their
: pocketbooks through lost sales. Be sure to tell them *why* they lost
: the sale too. Don't just tell the dealer, tell the zone rep too. It
: *may* do no good, amateurs are a small segment of the auto market, smaller
: than the public safety fleet market that such manufacturers are *also*
: ignoring, but it *may* help.

for a ham band repeater, plus the electricity to operate it and they also
would maintain the repeater!

2285. Improving CW speed

Newsgroup: rec.radio.amateur.misc
Date: 1994-08-10 06:58:44 UTC

Source record: 261947

Just a few recipees that worked at least in my case:
1) Just don't care, BE on the air in CW, the average operating speed is different on the various bands, 7 MHz and 3.5 MHz are better for hi speed operation (at least in EU)
2) Use at least an elbug with dot/dash memory, many hi speed operators prefer touch sensors. The paddles must be of good quality.
3) Don't be discouraged if others are faster than you... Try to contact fast stations, it's not a shame to ask for QRS. In general, hi speed ops start learning the code as teens and/or have a musical talent...
4) A general CW rule says you should never transmit faster than the station you are in contact with. You can break this rule when contacting old hams. The deterioration that Derek mentioned usually concerns the sending ability, not so much the hearing ability.
5) In EU there are several clubs that promote hi speed operation. To join you need sponsorships from other club members at certain speeds. Such a sponsorship QSO must last typically 30 min. There are clubs for 25 wpm, 40 wpm, 50 wpm, 60 wpm. If you have decent antennas to get thru to EU at hi speed CW, try to join (just ask for details on the air).
6) Try to avoid standard QSOs. Ragchew qsos are much better for training.

I sent Yuzu some ideas in email, but this post triggered some more things
I recall from the days when I could do 45WPM and argue with my mother about
why I should _not_ go to bed and why it was indeed essential to stay up to
0200 local time to work Pacific stations on 80M CW:

>Pracitce, practice, practice ;-)

Ain't no substitute.

>Two ideas:
>

> CQ'ing - you can hear their exchange several times to be sure you got
> it right. Of course, you have to keep moving, but it's good practice
> for call signs, numbers, etc.

Here is the best on-the-air practice you can find. It was true when I
worked my way up in speed, it was true when I wanted to find people who
could hold up their end of a high-speed QSO and it is still true today:

Listen on 40 meters, from about 7010 to 7035kc. This is where
you will find many high-speed CW ops who have been doing CW
for years and years and can sit there and ragchew with you
for hours. There is no other band where you will find the same
consisten concentration of high-speed CW ops with the same
regularity.

> - Get a computer program that will send random 5 letter sequences. (The
> one I use is the N6TR contest logging package, but there are probably
> others that will do this. Have it send the sequence at whatever speed
> you want, then have it repeat the sequence to see if you got it
> right.

The problem with this is that you will not make the letter-to-word
breakthrough. I found that high-speed CW was predicated upon making the
mental breakthrough of hearing and recognizing entire words as one "sound"
while copying.

Besides that, machine-generated CW sounds like, well, machine generated CW.
No swing, no cadence, no fist. In a word, Booooring.

I'll still take someone who knows how to use a bug over a keyer any day...

>voltage and amperage cause a problem? If it is a problem, I should
>just be able to add a resistor in series to get the amperage down,
>correct?

The nominal voltage of a fully charged car battery is 13.8 volts. That's why most fixed supplies put out that voltage. In a car, the charging system can increase that voltage to 14.5 volts, sometimes even 16 volts, so the radio has to be able to work with that if it can be run off the car. All you care about as far as supply current rating is concerned is if it can put out *enough* current. The radio will only draw as much as it needs, so a bigger supply is not a problem.

This is a basic Ohm's Law problem. Model the circuit like this:

```
----------------
+| |
Bat 13.8V Radio 6.9 ohms
-|_____________|
```

Assume the radio is a resistor (it's the load), and that if the radio normally needs 2 amps at 13.8 volts, it has a resistance value of 6.9 ohms. Now it doesn't matter how much current the 13.8 volt supply is *capable* of producing, at 13.8 volts it can only push 2 amps through a 6.9 ohm resistor. I=E/R or 13.8/6.9=2 amps. The only way the supply can push more than 2 amps through the radio is if the supply *voltage* is increased, or the radio resistance is somehow decreased (it can do that by outputting more RF or AF power). Let's assume a auto charging system voltage of 14.5 volts. Now how many amps will be pushed through the radio? The answer will tell you why higher voltage batteries allow HTs to transmit more power. (Remember P=I*E)

Now obviously solid state devices have an upper voltage limit, and exceeding that limit will destroy the device via voltage breakdown and current avalanche. So you never want to use a supply that has a higher voltage than the equipment is rated for. However, most equipment has a built in *safety* margin of about 20%, so you can *usually* apply a voltage of about 16.5 volts to a 13.8 volt rated radio without destroying it. A few tenths of a volt difference from rated voltage should never be a problem.

Source record: 261904

Here's a FYI regarding a fortunate experience with my particular vehicle and amateur installation, not a response to the warranty issue. It was successful in one Plymouth Voyger ('89) van, the only one I tried. Attempt an installation at your own risk! After reading these story threads, I am not assuring anyone success! Perhaps we can build a list of vehicles that have had amateur radios successfully installed without blowing automotive electronics.
I've been operating without problems (for a year) from my Plymouth Voyger ('89) van using 350 Watts output on 2 meter SSB/CW to a rooftop horizontally polorized omni antenna. Horizontal because of convention (& ground reflection gain and less noise) used by SSB/CW operators on VHF. [Trying to operate cross-polorized results in a loss of approximately 30dB!] I installed a 1 inch wide by 3 inch SHORT length rf ground strap between the power amplifier and the floor pan. The transceiver also has a short rf ground strap to ground (floor pan). Ofcourse all power cables go directly to the engine compartment battery. I also shielded (terminated at the battery terminal) the BIG (three #14 wires all connected to the positive battery terminal, w/ 70 Amp fuse) power lead to the power amp with one inch wide braid. These measures keep the rf on the OUTSIDE of the vehicle, where it belongs for more than one reason! I enjoy SSB because of the several hundred mile range without waiting for a repeater to free-up. Good luck with your installation. 73, WE7L (grid square DM41UN)

I also have a Ford Ranger. At the time I bought it I wasn't yet involved
in ham radio, so radio use wasn't a consideration. However, since then
I have installed a Yaesu FT2200 mobile unit. I was traveling this weekend
up to a hamfest and tried to reach some folks at the hamfest on a simplex
frequency using 50W. At the time we were on the interstate on cruise
control. There was no apparent effect on the cruise or my speed. However,
last April on the way to Dayton we were using a mobile, plugged into the
lighter, with a 1/4w mag mount antenna. That -did- affect the cruise
control when the mike was keyed (don't know what power was, but it was 35W
or less, probably 5). The decrease in speed was enough to feel, but not
enough to register perceptibly on the speedometer.

I don't know why the FT2200 doesn't affect the truck now (I'm not
complaining :-)), but maybe it's the installation. I have it wired
directly to the battery, and I'm using a 5/8w permanently mounted antenna
on the roof.

Ahem, this is why I put special "equipment" in quotes. Diesel engines
don't generally *have* an ECC. On fleet vehicles that do require an ECC,
IE gasoline engine powered, extra shielding is fitted as necessary. If
there is no ECC, the ECC can't suffer RFI. QED

>(at least here in OH most of the repeaters stay on maybe 15s after
>squelch closed, so it dont have to be a problem everywhere)

Yes, aside from the IDing problem, the fact that many repeaters use a long tail time can lock you out of your own crossband "repeater" for long periods. It is frustrating to want to break, but be unable to because no one allows the repeater carrier to drop so the crossband unit will turn around the link.

The problem, of course, is the half duplex nature of the system. It can't listen on the band on which it's transmitting until the signal on the other band making it transmit disappears. What's really needed is a different sort of system. The link to the remote HT could be duplex so that positive control can always be exercised. That would require in-band duplexers in the radio. Or the system could use channel *sampling* like the simpatches do. But none of the current amateur transievers has either of these options, so they make lousy "remote bases".

It may be possible to fool some of the rigs that have dual in-band receive capability by setting up the priority channel on the 2 meter side to monitor a 440 MHz frequency. You could then operate the 440 side split with the HT transmitting on one frequency and listening on another. If you held the PTT down for a moment, the priority scan would catch it and give you back control of the radio. It would still be "repeating" on 440 though, and you'd have to remote control it (perhaps by changing the 2 meter CTCSS squelch frequency) so the radio would stop retransmitting the 2 meter signal and perform a turnaround. Sounds like a kludge.

The best way is still to set up a true in-car repeater system on 440 and have a TT controllable link to 2 meters. That solves both the hang time problem, and the ID problem since the in-car repeater can have automatic ID. I note with interest that the new SERA 440 bandplan has provision for low power CTCSS controlled repeaters for itenerant operation.

Yeah, it's true. It's been in production for 10 years. That's not a
record though. I believe the Collins KWM-2 and S-line were in production
longer. The IC-735 is truly a great radio though.

Well, in keeping with my opinion on the misuse of the English language
by so many folks, including those on TV, and with Bob Greene's column in
yesterday's Chicago Tribune fresh in my mind, here is some information from
"The Gregg Reference Manual, Fifth Edition." To keep this on the subject
of amateur radio, HTs indicates > 1 HT and HT's indicates a single HT which
possesses something, e.g., my HT's VOX quit working.

ABBREVIATIONS, LETTERS, NUMBERS AND WORDS

a. The plurals of most abbreviations are formed by adding s to the singular.

dept. depts.
vol. vols.
engr. engrs.

b. The abbreviations of many customary units of weight and measure,
however, are the same in both the singular and plural.

oz (ounce or ounces)
deg (degree or degrees
bbl (barrel or barrels
ft (foot or feet)

For a number of these abbreviations, two plural forms have been widely used: lb or lbs, yd or yds, qt or qts, etc.

c. The plurals of a few single-letter abbreviations (such as p. for page and f. for the following page) consist of the same letter doubled.

p. 39
pp. 39-43
pp. 12 f. (page 12 and the following page)
pp. 12 ff. (page 12 and the following pages)

d. Capital letters and abbreviations ending with capital letters are pluralized by adding s along.

four Cs
IQs
PTAs
M.D.s
three Rs
YWCAs
Ph.D.s

e. For the sake of clarity, uncapitalized letters and uncapitalized abbreviations with internal periods are pluralized by adding an apostrophe plus s.

dotting the i's
counting the c.o.d.'s
p's and q's

f. Numbers expressed in figures are pluralized by the addition of s alone.

in the 1980s
temperature in the 40s
sort these 1040s and W-2s

g. The words taken from other parts of speech are used as nouns, they are usually pluralized by the addition of s or es.

ands, ifs, and buts
does and don'ts
yeses and noes
the haves and the have-nots

h. If the pluralized form is unfamiliar or is likely to be misread, use an apostrophe plus s to form the plural.

which's and that's
or's and nor's

i. If the singular form already contains an apostrophe, simply add s to form the plural.

ain'ts
doesn't
don'ts

I'm biting my tongue to not expound at length on medium (singular), media (plural), datum (singular), data (plural).

But, back to radio.

Also, did you ever notice that most every amatuer you talk to, especially those driving a vehicle, are never alone? Either he/she has someone else in the vehicle or he/she must have an invisible Siamese twin. "We're on our way to the store to buy a new rig," "We were working 20M yesteday and picked up an new one," "We're trying out our new bicycle," etc., etc. etc.

73,

John, WB9VGJ

>and the repeater's been ID'ed.

But only on one output. I guess every ten minutes you could switch to the other band and ID there again (the repeater has to ID on all freq's it's transmitting on).

But the real problem is when you've set up a crossband repeater because you're in an emergency setting and need local communications, you're not likely to remember (or to want to have to remember) to ID every 10 minutes on two bands.

Not to mention that technically your mobile crossband repeater must be remotely controllable so you can disable its transmit at any time...

> carrier, so, you arent able to talk through to input, right?

Carrier from repeater doesn't switch your mobile rig into rx:2m/tx:70cm until you drop your 70cm carrier, and vice-versa. In other words, it is keyed up by the first signal it gets, and doesn't swap bands until that signal goes away and a signal on the other band appears.

>(at least here in OH most of the repeaters stay on maybe 15s after
>squelch closed, so it dont have to be a problem everywhere)

The repeater hangtime problem is neatly solved by using tone squelch. If the repeater has an output tone, or if it will pass a tone from the input, you just use that tone to open the squelch on your mobile x-band repeater.

> faster character speed is giving me more dead air time between characters to
> figure out the character, and that dead time is absent when the word and
> character speeds are equal--what do you all think?

Me thinks this is what Farnsworth is all about...

> Anyway, here are my questions: should I continue with Farnsworth method?

Definitely so, Dave. At least IMHO.

> If so, what are the recommended speeds for initial learning? Is there any
> difference between 5 wpm "standard" and Farnsworth set to 5/5?

No cuz it ain't Farnsworth if the character speed and the spacing are the same.
The Farnsworth method lets you hear the characters at a faster speed but with
a wider spacing. Eventually you decrease the spacing but keep the character
speed up and your overall speed increases.

Many people [it seems to me] think that they can learn the code overnight.
Then when they don't, they give up and claim they can't learn it. I have
heard of people learning it in short order but most of the classes I have
taught seem to keep it at a comfortable pace and takes about eight weeks to
learn all the characters required to pass the 5WPM amateur exam. Most folks
left my sessions copying at about 7 or 8WPM. This is with no prior knowledge
of code. And, yes the Farnsworth method is always employed--starting off with
15WPM character speed and 5WPM spacing. Before the VE program started up and
when one person General Class or higher could give the exam, on the eighth
week of training I would give my students a "practice" exam. Anyone passing
the "practice" exam was delighted to know that it wasn't practice at all but
the real thing. Took the pressure off and about 98% passed. [Stats mine--
just an educated WHAG] Too bad we can't do that today.

I almost got beat up by one YL who took her code exam at a VE session I
worked. I looked at her solemnly, with CSCE in hand, and told her, "I'm
sorry....but......YOU PASSED!" So, you know there's a lot of pressure.

> And finally, if there *is* a difference, when I take the 5 wpm test, will
> that be the same sound as the "standard" or Farnsworth 5 wpm offered by the
> Morse Tutor program?

I believe you will hear 5WPM at 5WPM at the exam session.

> Oh, and one last thing: are there better PC Morse learning programs than
> Morse Tutor?

There are other programs out there. I use Super Morse myself. Morse Academy is a good one too I'm told. I'm sure there are some ftp sites where you can find this software to try for yourself. Wish I could be of more help where that is concerned.

Good luck to you Dave. It doesn't take luck but perserverence. Try listening on a shortwave or amateur receiver too after you've learned all the characters. Headphones work great. I use them to test candidates. You may find other VE teams that use them too. I never used them in any of my tests to obtain my licenses. Guess cuz they weren't available at the sessions I attended. But either way, good luck!

: gain of 2, that is R1=R2 (Closed Loop Gain=(1+R2/R1)). No matter what I apply
: to the input of the amp the output always saturates to -11 Volts. Even if no
: input is applied the output still gives a -11V.
: The voltages that I am applying to the Vcc+ and Vcc- of the op amp are +12V and
: -12V respectively. I am using the LM 741 opamp for this application.

: Does anybody in this group happen to know what the problem might be?

Hard to tell without seeing the circuit. One possibility: make sure you
have a dc return for the noninverting input. If you couple to the input
with a series capacitor (including, possibly, one that might be in the
output circuit of whatever audio circuit you use to drive the op amp),
put a resistor to ground from the noninverting input pin. A 10k
resistor should do.

2315. Speaker Mic PLUG to fit HTX-202

Newsgroup: rec.radio.amateur.misc
Date: 1994-08-10 17:20:50 UTC
From: mellis@ramcad.pica.army.mil
Message-ID: <CuBxIr.4zL@pica.army.mil>
Source record: 261919

I use my HTX-202 for packet (and everything else). What I'm looking for
is the molded plug (with leads) that the RS speaker mike comes with.
I can wire it up to the TNC, and make hooking up for packet easier.

Also comes in handy for other applications, like a desk mic connector. Or
modifying other speaker mikes to work with the 202.

Any suggestions (mail-order, probably) where I can get this?

Thanks!

***I'd be _very_ surprised if you "see" the dots and dashes at anything
over 10 wpm! Most people definitely hear the character as a whole sound
above that speed. It seems a logical continuation to hear whole words at
40+ wpm, although I, like a recent poster, tend to hear as words only
things like "the" and "...tion" and other extremely common strings of
characters. Again, I fade out somewhere above 30 but less than 50.

2318. Dielectric Constant of Magnet Wire Insulation???

Newsgroup: rec.radio.amateur.misc
Date: 1994-08-10 17:45:00 UTC
From: johnk@ATK.COM
Message-ID: <2E491232@msm.ATK.COM>
Source record: 261972

I am attempting to generate a table of characteristic impedances of parallel magnet wires for use in winding transmission line transformers. I plan to use Belden magnet wire (have it on hand) for some of the transformers.

Belden can give specifications for the average thickness of the insulating coating, but has no idea what the dielectric constant of the materials are, according to their telephone tech support.

There are two covering types involved, both covered by Federal Standards (neither of which list the dielectric constant of the insulators). The first is called:

1 "...dual film. ....underlying coating shall be .... polyurethane resin. The superimposed coating.... shall be polyamide resin." (Belden "Belsol")

2 "...dual film. ...underlying coating shall be... polyester, polyester-imide or a polyester-amide-imide resin. The superimposed coating ... shall be ...a polyamide-imide resin." (Belden "Heavy Armored Poly-Thermaleze")

It is pretty easy to calculate the characteristic impedance of a parallel line transmission line if the separation and dielectric constant are known, but in this case:

A. Does anyone know what the dielectric constant of the materials listed above are, and;

B. How do you mathematically treat the case that the wire actually has two concentric coatings of dielectric material and they may (probably are) two different dielectric constants.

Any help from the physicists / engineers out there would be appreciated. Please respond directly to: johnk@ATK.COM or to the net (or both).

John, WB4LNM

How true.

I have a brother in Dayton, Ohio who I've pestered for years to get his technician class license. He's hold a BS in electrical engineering technology, and could pass the technical part of the test without studying. He would have to study the rule and reg's, but that wouldn't take long. To date, he has yet to purchase a study guide, although he does maintain some interest in the hobby. (We did go to the Dayton Hamvention together.)

On the other hand, my sister-in-law got interested in the hobby all by herself. About four months ago, we were driving to New Jersey to attend my cousin's wedding, and I had my 2 meter rig in the car. She started asking me all sorts of questions about it. (How does it work? How far can you talk? What's a repeater?) She finally asked how she could get a license. (I never brought the subject up myself.) About a month later she got a copy of `Now You're Blabbing,' studied it for two week, and passed her exam. Her call sign is N3SYE.

Like anything else in life, a person generally can't be nagged into doing something. They have to want to do it for themselves.

|> seeing them when I'm listening to code after all.

I don't see dits and dahs - speaking for myself. Words pop up and then
for unfamiliar words the string of letters popup. At the slow speeds
below 25 wpm it's a letter by letter type operation and a few words.
I also find that I buffer internally at any speed, and once in a while
at high speeds I will lose some stuff because of a single letter being
missed in an unfamiliar word. I cease copying and 'play back' the part
that I missed. I can't explain the details. See next paragraph.

|>
|> It's probably like going to sleep - if you think too hard about how to do
|> it, you'll be awake all night. There was no magic that took me from 0
|> to 35 wpm except using the code a lot, and treating it as fun rather than
|> a chore.

It's the 'centipede syndrome' - if you ask how someone does it, they lose
it trying to think about the details. I don't think that anyone can sit
down and say 'this is the way my son' to do this. There is no cookbook CW
for everyone. Play at it and it will come. If it's work, you'll never
ever like it until you 'chill out'. There is no instant learning for
this stuff - like most stuff worth learning it just takes time. Pay your
dues and get on with your life.

|>
|> I was off the air for 25 yrs and when I got bitten again I found that I
|> could copy CW at 20+ wpm as soon as I heard it again. It's encouraging
|> to know that it stays in deep freeze. The thing I have to worry about
|> now is my speed going down, now that I am into my second half-century,
|> just from natural deterioration. Anyone want to comment on whether
|> this happens, or is code copying the last thing to go, after you have
|> forgotten your wife's name and your telephone number?
|>

I too was off (about 10 yrs) and came back at 40wpm and within a few
weeks was back to high speeds. As long as you don't destroy whatever
part of your brain that is important for this stuff, it should still
work. I've never even experimented with drugs and think that's why

I still remember everything that I'm trying to forget. :-)

I am about to hit the big 52 in September. I don't think that aging effects have set in. I've always had days where 60+ is a breeze and others where I have to work into it for a short period of time (5 to 10 minutes I'd guess) to get back to comfortable copying. I hope and pray that CW is the last thing to go. Which wife? Which telephone? - the home, cellular, fax, office, ... :-) As another side light, my ears still work good. I hear people whispering behind my back all the time. Paranoia - a wonderful disease. :-) My English ain't so good either.

Any idea why the Antietam Group did not advertise this year ? I got a flier only because our
club participated last year. Many of our members are irritated that they did not advertise in
QST, WroldRadio , etc...

From: depaul@spk.hp.com
Message-ID: <CuC28G.HHw@spk.hp.com>
Source record: 261886

Hello.

I've read a lot of EMI/RFI hazard stuff and now I'm even
more confused as to whether I'm going to die from radiation
or not...

Let me get a straight forward answer, in plain, direct English
if MY particular ham set up will eventually kill me:

I'm running a TS850 (100 W) with the rig placed approximately
3 ft from my body. I sometimes use my Clipperton L amplifier
which pumps out about the legal limit...this is placed five
feet from my body. I use an OPEN balanced antenna tuner
which uses two roller inductors and three very large capacitors;
this and some of the prefab ladder line is nine feet away from
my body. I mainly do SSB on 40/20/17 meters.

Thanks,

Marc D

2324. Manual for Tektronix P Type Plug-in

I would like to obtain a copy of the manual for a Tektronix Type P plug-in. As this unit is not very complicated I expect the manual isn't very extensive and I'm mostly interested in the procedure to adjust the coil current.

Tnx es 73,
Barry W5KH

A FOAF tells me that some BMW cars have a warning about using cellphones
in the car without an outside antenna. Seems it interferes with the
operation of the engine computer, though it doesn't seem to kill it.

My father's Mercury Sable's turn signal frequency doubles when he keys
up on 220 or 440. No other apparent effects with rigs covering from 80m
up to 440 (50-100W out).

Someday I'll be able to afford cars with this problem. All of mine have
these weird carburators and point-condensor ignitions! I'll be the only
one on the road after the EMP :-)

[Author was Brent Mirchandani]
[Posted on 10 Aug 1994 17:45:37 GMT]

Hello,

I am looking for any recommendations on 2M mobile rigs. I am looking for a rig that is resistant to intermod. It will be mounted in an '89 Chevy pickup so size is not an overwhelming concern. I have been considering an ICOM IC-281H, YAESU FT2200 or FT2400. Any comments or suggestions?

I am new to ham radio, so I may be a little off the mark here. (I am not quite sure what a DX cluster is versus a packet bulletin board.) There is a packet radio node which is accesible through INTERNET way down here in Alabama, at my alma mater, Auburn University. Telnet to 131.204.48.13 and you will find K4RY, a well equipped and thorough system which allows you to go keyboard to keyboard with other hams from all over the world. Many users are accessing through wireless packet, others access through internet, others access through dialup.

good luck, 73 KE4KUZ, Doc Elliott in Huntsville, Al

Hi Greg, you may not know the origin of the term "we" as far as ham radio goes. It is a side effect of learning Morse Code which tends to split the brain into two distinct parts, one for normal stuff and one for emulating a modem. The split is so severe that the individual perceives two distinct entities existing within his brain and starts referring to himself as "we". It must be true because it happened to us right after we got our first ham ticket.

Gee, Cecil, I was hoping to elicit something besides another rap on
CW! Actually, it is those damn modems which are emulating we old CW
operators. Why, back when I was a kid (:-), they didn't even _have_
modems! Seems machines are always taking over our creative efforts.
They are fast, accurate, and stupid, and they don't know how to have a
good time! I've been enjoying Morse since I was 11, and our
(oops...MY) brain is still in one piece!

Weeeeeee!

Greetings!
I couldn't get above 200 w.p.m. sending until changing over to a dynamically balanced titanium spring on the Speed-X J-38. The stock one would fly off at about 100 w.p.m. scaring the cat.
On receive it was different. I had to fasten the clipboard onto a 3" thick maple-laminated workbench top using 3/8" lag screws writing on mylar sheets with a high-speed chart recorder pen assembly before 150 w.p.m. was feasible. The regular pencil leads would break or rip the paper. For some reason copying is more difficult for me than sending.
I use a special code that enables writing down a sentence at a time:

"My rig is a __________" = X. Specific device in the final would be interesting.
"I don't get out much." = X.
"The temperature here is 20 degrees" = X. Is it F or C?

To all radio amateurs

SB QST ARL ARLB066
ARLB066 FCC garners award

FCC garners award

The Federal Communications Commission's ''Auction Team'' has received the Hammer Award ''for reinventing government initiatives.''

The Commission said that the award recognized that the auctions (which were for narrowband Personal Communication Service spectrum and interactive video allocations) served consumers by licensing new services faster, served the public by selling rights to the spectrum rather than giving it away, and served industry by getting licenses to those ''who value them most highly.''

The FCC Auction Team includes employees who worked on allocation and auction rule making as well as the team that organized and carried out the actual auctions in late July.

After 47 rounds of bidding, the PCS auction earned more than 600 million dollars for the ten nationwide licenses being auctioned. An interactive video spectrum auction earned an additional 214 million dollars for 574 licenses that will be used for new broadcast services.

Vice President Al Gore made the award presentation. He said ''Small and independent (government) agencies have been leaders of reinventing government. At the FCC, which has less than 2,000 employees, reinvention efforts have moved the agency from red tape to real results. Employees of the Commission have set a new standard for government performance, putting their customers, the American people, first,'' Gore said.

Hi,

I have been living in the US for almost 3.5 years, beore that I used to
be pretty active HF from India.

I am keen to get back into it. I am not sure what the rules and regulations
and the classes of licenses in this country.

Can someone please give me some pointers on where to start, and how easy/hard
is it for me to get a license transferred (to the equivalent class).

Thanks,

Ravi (VU2RVH)

Mike-

The subject line said MFJ-1224, although your message said MFJ-1244. I think the one I had was the MFJ-1224, which required a Kantronics plug-in module for the Commodore VIC-20 computer. Although there may have been plug-in modules for other computers, they were models that are now obsolete. (I'm not sure the IBM-PC had come out back then.)

Kantronics had their own interface, which I believe the MFJ is patterned after. Therefore, you won't get any help from Kantronics if you don't know their equivalent model number! Best bet is to call MFJ's 800 number, and ask for advice.

Mine worked great on RTTY, but I never used it on CW.

The ARRL exams are as follows:

1A: 5 WPM at 16 WPM Farnsworth
1B: 13 WPM at 18 WPM Farnsworth
1C: 20 WPM at 22 or 23 WPM (can't remember)

If you learn code Farnsworth, you'll have a easier time upgrading.

==Ken

2340. Re: Help! How to Improve my CW Speed?

Newsgroup: rec.radio.amateur.misc
Date: 1994-08-11 00:02:37 UTC
From: bobr@on-ramp.ior.com
Message-ID: <32bpqt$8g0@on-ramp.ior.com>
Source record: 261960

There have been quite a few good suggestions in this thread regarding how to copy high speed CW. I think the entire process can and should be reduced to one simple analogy. How do we process the words we hear when someone speaks our language? Do we write the words down on paper first and then analyze what we thought we heard? No..our mind converts sounds into something meaningful. This is an instantaneous process largely through conditioning and repetition. If treated the same way as learning a new language, the proper method for increasing your code speed should become evident. Perhaps this is an over simplification, but it has worked for me. Young children first learn to speak the alphabet, then words, stumbling all the while and as time marches on their speech and comprehension levels mature..all of this takes time and practice.

2341. Homebrew Global Positioning System (GPS)

Newsgroup: rec.radio.amateur.misc
Date: 1994-08-11 00:18:22 UTC
From: wmoyes@eis.calstate.edu
Message-ID: <32bqoe$ur@eis.calstate.edu>
Source record: 261967
Cross-posted to: alt.2600,rec.radio.amateur.homebrew,rec.radio.amateur.misc,rec.radio.amateur.space

I need information for a homebrew GPS (Global Positioning System). Books, magazines, references, and internet resources would be extremely helpful. I need information on theory, frequencies and modulation, and circuit schematics. Although I would prefer to build my own, any information about commercially available units would be helpful (specifications, sources, and prices), however I will need to hook the output of the device into other equipment. I am also seeking good information on how to set up an experiential differential GPS system.

2342. Mobile radio in Acura Integra?

Newsgroup: rec.radio.amateur.misc
Date: 1994-08-11 00:58:48 UTC
From: greg@core.rose.hp.com
Message-ID: <CuCIq0.GH0@icon.rose.hp.com>
Source record: 261907

Well, this general topic seems to be the rage right now, so I'll ask my $.02.

I am planning on installing a mobile rig in a '94 Acura Integra GS-R. The plan is to use a Kenwood 733, mounted under the driver seat, with the remote display on the dash below the radio. Heavy wires (12ga?) go direct to the battery, though I haven't found a good route yet. Each has a fuse, and the positive goes through a relay tied to the ignition so that the radio goes off when the engine is turned off, maybe with an override switch. I know that Gary and others tell me to drill the hole, but I just can't do that, so for an antenna I plan to use a Larsen dual-band glass mount on the side window on the driver side. Mount the antenna as high as possible in the window, yet still have the top of the antenna below the garage door - probably puts the glass mounting thingy about in the middle of the window. Oh, and I probably need to have the radio itself grounded where it's mounted, I expect to one of the bolts on the seat's mounting rails.

I know this plan has compromises: antenna on the side of the car is not as good as the middle (height restriction), on-the-glass antenna not as good as through-the-metal, etc.

BUT - is there anything glaring that I have forgotten? I didn't see any mention of warranty problems, and the dealer didn't know of any either, although I didn't ask *everyone* about it, or have them sign anything. I have read reports of problems of ignition noise, so perhaps I would need to do some bypassing and/or ferrite-ing of the power wires. My fingers are crossed, however, since the reports were for the 89-90 cars which were known for having "igniter" problems.

Did I miss anything?

Thanks,

Greg KD6KGW

2343. PKGOLD Enhanced PROBLEMS

Newsgroup: rec.radio.amateur.misc
Date: 1994-08-11 01:15:02 UTC
From: richard@cyberspace.com
Message-ID: <32bu2m$kfu@cyberspace.com>

TO ALL HAMS USING PKGOLD ENHANCED

I have ran into a problem with the latest version of PKGOLD Enhanced
with Pactor. It seems to exit the program with the following:

DISK ERROR 100
DISK READ error
record -1 in GOLD.BD

This is found on the screen after the program dumps out. Timing of the
exit from the program is random meaning 5hrs or 1hr after loading the
program and has even done it while in the connect mode as well. It will
leave the TNC open so that the buffer fills up and no connects can
happen. Having the ***SAME*** version for the Kantronics TNC (KAGOLD)
for use with the KAM+ and the KPC models and using the ***SAME*** computer
WITHOUT ONE problem at any time and I can leave it without worry
PKGOLD I can not do that at all. (also tried it on other computers with the
same results)

One other problem I have notice is that opening a connect window it is
full of junk chars which should not be there. ?????????? (PKGOLD ONLY)

Interfex claims it doesnt have any problems and thinks it mine. Why can
I run the same versin for the Kantronics TNC without any problems but
yet I can not run the PKGOLD (extra cost) with the AEA products.
(PK-232, PK-88, PK-96)

Also how many commercial programs leave out the manual because you have it
with your other versions of gold

Has anyone seen or have the so called DUALPORT PKGOLD yet.

Hi Ken, I have a stupid question. Does anybody actually send Farnsworth-
sounding code on the air? I've never heard it on the air and am wondering
why learn sounds in a way that will not be encountered in operation?

>
>OK, so now you have a 440 extender you can take down to the canyon where
>the fish are...

You are correct, sir, but the original post implied to me that there
was not a regular repeater involved (2m simplex was mentioned). I don't
think it was so much a case of a "repeater extender" that was being
sought as a high-up kick to get around the hills and out of the
dales*. If this were the case...

2m HT---> 2m x 440 mobile---> 440 HT
and
440 HT---> 440 x 2 mobile---> 2m HT

wouldn't the two-rigs constitute a SINGLE repeater? As long as
each op ID'ed "The Repeater", you have an id on each freq, thus are legal.

The other vision is a single mobile x-banding with the "base" on
one freq and the field guys on the other. Since the x-band radio
transmits both ways, the same "WX2ABC repeat" tagged onto a call in
either direction should also meet the requirements. (Remote control of
The Repeater is a whole other matter, but if WX2ABC just sat in the car...)

Or am I making this harder than it has to be?

2346. dual band radios, full duplex operation

Newsgroup: rec.radio.amateur.misc
Date: 1994-08-11 02:15:53 UTC
From: steve@media.mit.edu
Message-ID: <1994Aug11.021553.20976@news.media.mit.edu>
Source record: 261881

I was wondering if anyone has had experience with both single band radios and dual band radios. How do you find the performance compares, say between a dual band radio set to 2m and a single band 2m radio. Is something sacrificed in the design, making the radio operate on two different bands (e.g. are the tradeoffs drastic enough that the performance of both bands is impaired)?

Looking in the HRO catalog, I see most of the dual band radios also feature full duplex ``telephone-like'' capability.

Some of the single band transceivers receive on another band (e.g. the ICOM IC-21A is a transceiver on 2m and a receiver on 440MHz), and also claim ``full duplex cross band operation''. Would the reception be reasonable on 440MHz? Or would the reception be poor, given that the IC-21A is really optimized for 2m?

Just wondering if anyone's tried full duplex, and if so, is it better to do it with 2 separate radios (e.g. a 2m transciever and a separate 440MHz transceiver), or would you get better performance doing it with a dual band radio, such as an FT530 or DJ580.

Cecil, I usually have my character speed setting somewhere around 20WPM when
I am operating in the Novice bands and conversing with those of the slower
speed persuasion. [On the lower ends of the bands I am usually of the slower
persuasion myself] But I figure it might help someone trying to get their
speed up. I haven't received any complaints, no QRSs or the like. A few
stations have mystically disappeard....hmmmmmmm. But I hear many stations
employing Mr. Farnsworth's methodology on the air. It's how I got my speed
up to and beyond 25WPM. I listen to code every day, even right now I am
hearing stations sending at about 20WPM with approximately a 25 to 30 character
rate at 14.025 on 11 Aug 94 at 0236Z.

Hope this contributes to your question.

First of all, I'd like to thank everyone whose answered my questions until now - you've all helped a _lot_ and you can congratulate yourselves for getting another person who wasn't so sure about ham radio to 'take the plunge'

well, I go for my exam this Sunday - at a hamfest that I wanted to tell y'all about - I heard about it through a friend - it's gonna be up near Bangor, PA [that's in the Lehigh Valley - kinda near Allentown] this sunday, and if anyone is interested, I can provide directions...

I also think I've decided what I want as my first unit...I want to get the Kenwood TH-22AT - it's a 2m handheld...and if anyone has any feedback about it - I'd love to hear what you have to say - please bear in mind that I'd like to get into packet radio - and if you know how well this radio works for packed - I'd love to hear what you have to say - I've seen it around for about $250 which seems to be the industry standard....well, wish me luck on the exam - and I hope to be on the air soon!

2356. Farnsworth Method in Code Exam

Newsgroup: rec.radio.amateur.misc
Date: 1994-08-11 05:25:55 UTC
From: ys@isr.harvard.edu
Message-ID: <32ccp3$i0s@scunix2.harvard.edu>
Source record: 261913

I just wanted to clarify how the Farnsworth method is used in the code exam. It depends on a particular VEC. In the case of the ARRL, it is used as follows:

* Element 1A (5 WPM): Character Speed = 18 WPM
* Element 1B (13 WPM): Character Speed = 18 WPM
* Element 1C (20 WPM): Character Speed = 20 WPM

Thus, the Farnsworth method is used in Elements 1A and 1B, but NOT in 1C. This is documented in ARRL's Volunteer Examiner Manual, 6th edition, copy right date 1991, 3rd printing, 1993, page 54.

The 3-Hr Ap Indices for 09 AUG 94 are: 5 6 4 2 3 6 7 11
Greater than 2 MeV Electron Fluence for 10 AUG is: 2.2E+06

SYNOPSIS OF ACTIVITY

Solar activity continued very low. Region 7762 (N04W37)
grew slightly. A small region emerged near S13W16 and was
numbered as new Region 7763.

Solar activity forecast: solar activity should continue
at a very low level. There is the slight possibility of a
C-class flare from Region 7762.

The geomagnetic field began the period at unsettled
levels. After midday, mostly unsettled to active conditions

were detected. Some high latitude sites experienced minor storming.

Geophysical activity forecast: overall, the geomagnetic field should be active. Periods of minor storm are possible. Some high latitude sites may experience isolated periods of major storming. Energetic electron fluxes at geosynchronous orbit should increase on 11 Aug in response to the current disturbance.

Event probabilities 11 aug-13 aug

Class M 01/01/01
Class X 01/01/01
Proton 01/01/01
PCAF Green

Geomagnetic activity probabilities 11 aug-13 aug

A. Middle Latitudes
Active 40/40/40
Minor Storm 20/20/15
Major-Severe Storm 10/10/05

B. High Latitudes
Active 50/50/45
Minor Storm 30/30/20
Major-Severe Storm 10/10/05

HF propagation conditions were near-normal over most regions early in the day, but began deteriorating as the day progressed. Minor signal degradation has been observed over the high and some middle latitude paths, particularly on transauroral circuits where auroral activity has increased. These conditions should persist through 13 August.

NOTES:
All times are in Universal Time (UT). Characters preceding begin, max,
and end times are defined as: B = Before, U = Uncertain, A = After.
All times associated with x-ray flares (ex. flares which produce
associated x-ray bursts) refer to the begin, max, and end times of the
x-rays. Flares which are not associated with x-ray signatures use the
optical observations to determine the begin, max, and end times.

Acronyms used to identify sweeps and optical phenomena include:

II = Type II Sweep Frequency Event
III = Type III Sweep
IV = Type IV Sweep
V = Type V Sweep
Continuum = Continuum Radio Event
Loop = Loop Prominence System,
Spray = Limb Spray,

2359. Military Radio

Newsgroup: rec.radio.amateur.misc
Date: 1994-08-11 09:03:58 UTC
From: lenwink@indirect.com
Message-ID: <lenwink.160.0009113D@indirect.com>
Source record: 261889

I'm looking for a guest to be on the Ham Radio & More show that is a military radio veteran that could discuss non-classified aspects of radio used in counterintelligence measures and other information gathering techniques. It would be most interesting to the average ham as well as to the non-ham. Please e'mail me if you can help or have a suggestion. Ham Radio & More is on the Talk America Network in over 20 cities and via satellite on Spacenet 3, Transponder 9, 6.8 audio each Sunday at 6:00pm EST.
73, Len, KB7LPW

2360. Caver's radios?

Newsgroup: rec.radio.amateur.misc

From: lenwink@indirect.com
Message-ID: <lenwink.163.00099B84@indirect.com>
Source record: 261894

Anybody familar with special radios and equipment used by people who
are cavers and want to penetrate deep underground? Don'y know if this
is a popular subject or not, but would like to explore the topic on a future
Ham Radio & More show. Are you into this aspect of radio or know who
is, please let me know. It's for the Ham Radio & More show heard
nationally on the Talk America Network in over 20 cities and via satellite
on Spacenet 3, Transponder 9, 6.8 audio, every Sunday at 6:00pm EST.
73, Len, KB7LPW

2361. W2NSD

Newsgroup: rec.radio.amateur.misc

Message-ID: <lenwink.164.0009B2BD@indirect.com>
Source record: 261898

Just a quick reminder that Wayne Green, W2NSD, will be the special
guest on the Ham Radio & More show this Sunday, 8/14/94. Wayne
will discuss his background, his opinions, and more. The show can be
heard on the Talk America Network in over 20 cities and via satellite on
Spacenet 3, Transponder 9, 6.8 audio. It airs live at 6:00pm EST. Call
602-241-1510 for more information.
If you cannot hear the show, but want to ask Wayne a question, call our
listener call-in line at 1-800-298-talk around 6:00pm EST and you can be
put on hold to hear the show until it's time to ask your question of Wayne.
He'll also be on the local show the following hour at 1-800-293-kfnn.

Your best bet is to contact the Radio Society of Great Britain (RSGB),
and they will point you in the right direction.

Although I can't remember their address off the top of my head,
their telephone number is: +44 707 659015, and there is someone to
answer the telephones between 9:00 am and 5:30 pm local time
(currently one hour ahead of UTC).

I think the ARRL can probably help you as well, if you don't fancy making
telephone calls to the UK ...

I believe that to operate in the UK, you must apply for a reciprocal
license, as that is what I would need to operate in the US [:-)], but I
don't know how long a reciprocal license is good for - that's a question
the RSGB or ARRL can answer.

Good luck,

73, Scott

The reason you're confused is that the fright-mongers can blithly say,
"Radiation is going to kill you," while those who try to make _rational_
statements haven't the luxury of such blanket statements.

If history is any guide, the tens of thousands of living hams are proof
that, No, it's _not_ going to kill you, or make you sick, or make your hair
fall out, or any of the other horrendous things the fright-mongers use to
attack everything technological. Is that plain enough? Nobody has ever
established any link between the radiation from operating an HF amateur
radio station and any health-related problem.

Go enjoy the hobby and stop reacting every time some Luddite screams "doom"
at technology. :-)

They must have more than one set of exam tapes. The Element 1A tapes we
use at our VE sessions (ARRL tapes) are _no way_ 16 wpm characters!
They're _slow_. I couldn't say if they're actually 5 wpm characters, but
definitely not 16.

2368. Morse tutor-like program for Mac?

Newsgroup: rec.radio.amateur.misc
Date: 1994-08-11 12:27:08 UTC
From: lgoodin@worldbank.org
Message-ID: <lgoodin-110894142708@lgoodin.worldbank.org>
Source record: 261861

Once upon a time, I ftp-ed a Morse program for the Mac -- I think it was even called "Morse Tutor," although I could be wrong. I also seem to recall it was written by a German.

I need to find it again! Any suggestions as to sites?

Thanks and 73,

Laura

[[EXAMNT8.10 : 2056 in EXAMNT8.10]]

AMATEUR RADIO EXAMINATION OPPORTUNITIES

****

Special Note: Amateur Radio licenses usually arrive between 8 and
10 weeks after the test session. The FCC recently has been taking
upwards of 14 weeks to process licenses (although as recently
as this week, some licenses have come through in six to eight weeks.
The FCC considers their processing time to be 90 days--from the date
they receive the application. The FCC usually receives the application
one to two weeks after the test session (once the VE Team and the
coordinating VEC have completed their processing).

Note: Codeless Technician to Technician w/HF upgraders (who pass a
Morse code test) will effective 6/8/94 receive a new license from
the FCC that reads "TECH PLUS." Such upgrades before that date
would not receive a new license but would need to retain the
existing Technician license plus the CSCE conveying the Morse
code test credit as the only documentation issued for use of
the additional HF privileges.

****

The following test session information is provided by the
ARRL/VEC for the upcoming eight to twelve week period. For
further information, please contact the test session CONTACT
PERSON at the telephone number provided. If necessary, you
may contact the ARRL/VEC at 203-666-1541 x282 for additional
information. Electronic mail may be forwarded to the ARRL/VEC
via USENET at "bjahnke@arrl.org" or via MCI Mail to
MCI ID: 653-2312 or 215-5052.

Although the test session information presented here does
not indicate whether walk-ins are accepted or not, most test
sessions do allow walk-ins. We encourage you, however, to
always contact the CONTACT PERSON at the telephone number
provided so that the VE Team is aware that you be attending
the test session.

STILL NEED TO PREPARE FOR YOUR EXAM?

If you would like information on how to become licensed; or
how to locate Amateur Radio clubs, instructors, licensing
classes and/or Novice examiners in your area; please contact

the ARRL Educational Activities Department (EAD) at 203-666-
1541 x219. The EAD can also provide information on
recommended study materials. Electronic mail may be forwarded
to the ARRL EAD via USENET at "rwhite@arrl.org" or via MCI Mail to
MCI ID: 215-5052.

EXAM LISTINGS - DEFINITION OF FIELDS

STATE
Test Date,VEC,City,,Contact Phone,Contact Person

The SECOND field in the following listing specifies the VEC
which is coordinating this examination. This single-character
designator denotes the VEC as defined below. An "A" (for example)
indicates that this examination is coordinated by the ARRL/VEC.

For further information on any examinations listed, or if you do not
find any examinations listed for your area, you may contact
any of the coordinating VECs below.

A = ARRL/VEC, 225 Main St, Newington, CT 06111; (d) 203-666-1541
The 1994 test fee is $5.75.

X = Anchorage ARC, 2628 Turnagain Parkway, Anchorage, AK 99517;

2370. US License Examination Opportunities Scheduled 8/10/94 to 10/10/94

Newsgroup: rec.radio.amateur.misc
Date: 1994-08-11 12:32:00 UTC
From: "Jahnke, Bart, KB9NM" <bjahnke@arrl.org>
Message-ID: <2E4A1B0C@arrl.org>
Source record: 261857
Cross-posted to: rec.radio.amateur.misc,rec.radio.info

AMATEUR RADIO EXAMINATION OPPORTUNITIES

****

Special Note: Amateur Radio licenses usually arrive between 8 and
10 weeks after the test session. The FCC recently has been taking
upwards of 14 weeks to process licenses (although as recently
as this week, some licenses have come through in six to eight weeks.
The FCC considers their processing time to be 90 days--from the date
they receive the application. The FCC usually receives the application
one to two weeks after the test session (once the VE Team and the
coordinating VEC have completed their processing).

Note: Codeless Technician to Technician w/HF upgraders (who pass a
Morse code test) will effective 6/8/94 receive a new license from
the FCC that reads "TECH PLUS." Such upgrades before that date
would not receive a new license but would need to retain the
existing Technician license plus the CSCE conveying the Morse
code test credit as the only documentation issued for use of
the additional HF privileges.

****

The following test session information is provided by the
ARRL/VEC for the upcoming eight to twelve week period. For
further information, please contact the test session CONTACT
PERSON at the telephone number provided. If necessary, you
may contact the ARRL/VEC at 203-666-1541 x282 for additional
information. Electronic mail may be forwarded to the ARRL/VEC
via USENET at "bjahnke@arrl.org" or via MCI Mail to
MCI ID: 653-2312 or 215-5052.

Although the test session information presented here does
not indicate whether walk-ins are accepted or not, most test
sessions do allow walk-ins. We encourage you, however, to
always contact the CONTACT PERSON at the telephone number
provided so that the VE Team is aware that you be attending
the test session.

STILL NEED TO PREPARE FOR YOUR EXAM?

If you would like information on how to become licensed; or
how to locate Amateur Radio clubs, instructors, licensing
classes and/or Novice examiners in your area; please contact
the ARRL Educational Activities Department (EAD) at 203-666-
1541 x219. The EAD can also provide information on

recommended study materials. Electronic mail may be forwarded
to the ARRL EAD via USENET at "rwhite@arrl.org" or via MCI Mail to
MCI ID: 215-5052.

EXAM LISTINGS - DEFINITION OF FIELDS

STATE
Test Date,VEC,City,,Contact Phone,Contact Person

The SECOND field in the following listing specifies the VEC
which is coordinating this examination. This single-character
designator denotes the VEC as defined below. An "A" (for example)
indicates that this examination is coordinated by the ARRL/VEC.

For further information on any examinations listed, or if you do not
find any examinations listed for your area, you may contact
any of the coordinating VECs below.

A = ARRL/VEC, 225 Main St, Newington, CT 06111; (d) 203-666-1541

The 1994 test fee is $5.75.

X = Anchorage ARC, 2628 Turnagain Parkway, Anchorage, AK 99517;

(d) 907-786-8121, (n) 907-243-2221 (or) 907-276-5121

(or) 907-274-5546

C = Central Alabama VEC, 1215 Dale Dr SE, Huntsville, AL 35801;

205-536-3904

N = Charlotte VEC, 227 Bennett Ln, Charlotte, NC 28213;

704-596-2168

D = Great Lakes ARC VEC Inc., 3040 Harrison St, Glenview, IL 60025;

708-486-8019

E = Golden Empire ARS, PO Box 508, Chico, CA 95927; No phone.

G = Greater Los Angeles ARG, 9737 Noble Ave, Sepulveda, CA 91343;

818-892-2068, 805-822-1473.

J = Jefferson ARC, PO Box 24368, New Orleans, LA 70184-4368;
504-737-2315. Test fee for 1994 is $5.00.

K = Koolau ARC, 45-529 Nakuluai St, Kaneohe, HI 96744;

808-235-4132

L = Laurel ARC Inc., PO Box 3039, Laurel, MD 20709-0039;

(d) 301-572-5124, 301-317-7819, (n) 301-588-3924

M = The Milwaukee RAC Inc., 1737 N 116th St, Wauwatosa, WI 53226;

414-774-6999. Test fee for 1994 is $5.00.

H = Mountain ARC, PO Box 10, Burlington, WV 26710; 304-289-3576,

301-724-0674

P = PHD ARA Inc., PO Box 11, Liberty, MO 64068; 816-781-7313

R = Sandarc-VEC, PO Box 2446, La Mesa, CA 91943-2446; 619-465-3926

S = Sunnyvale VEC ARC, PO Box 60307, Sunnyvale, CA 94088-0307;

408-255-9000

T = Triad Emergency ARC, 3504 Stonehurst Pl, High Point, NC 27265;

919-841-7576

W = Western Carolinas ARS VEC, 5833 Clinton Hwy - Suite 203,

Knoxville, TN 37912-2500; 615-688-7771.

The 1994 test fee is $5.75.

5 = W5YI-VEC, PO Box 565101, Dallas, TX 75356-5101; 817-461-6443

The 1994 test fee is $5.75.

>for me. Young children first learn to speak the alphabet, then words,
>stumbling all the while and as time marches on their speech and
>comprehension levels mature..all of this takes time and practice.

No, young children *don't* first learn to speak the alphabet and then words.
Most children don't start being taught their ABCs until they are 5 or
6 years old. By that time, they are already fluent in spoken language
with a vocabulary of at least 500 words. Most of those words they will
have picked up without formal training. It's been shown that a 3 month
old infant already recognizes some words. The ability to detect these
patterns is apparently wired in. Words are the smallest meaningful
unit of language, the alphabet is a visual encoding tool for words. This
encoding is artificial and has to be taught. Morse is another level back
in that it's a sonic encoding of the visual alphabet, which also has to be
taught. No one learns a double indirect pointer before they learn the object.

It's true that the alphabet is taught before *written* representation
of words, formed by combinations of alphabetics, IE spelling, is taught.
But that's considerably different from sonic representations of words,
which are apparently detected by pattern matching circuitry that's wired
into the brain. Few people hear complete words when their letters are
spoken one at a time. And going a step more indirect, few people hear
words when they listen to serial combinations of simple tones representing
letters.

There's a double interpretation going on in the middle. Good operators
apparently do this subconsciously in a letter serial fashion and assemble
the letters into words in another subconsicous process. A lot of cognitive
research has gone into trying to discover exactly how these processes
work, and how the words are then processed into meaning. It's still not
fully understood. So there's no sure recipe for success.

Repetitive drill seems to condition the brain to form these association
chains, but each individual probably forms a unique association in

response to the conditioning. That implies that methods that work for one person may not work as well, or at all, for another. Musical "talent" is a good analogy here. Some people seem to naturally recognize the patterns represented by music, while other people are stone tone deaf. That doesn't mean there's a fault with their hearing, it's a fundamental difference in the way their minds process the sonic information into associative chains. The mechanism for making tones can be learned by anyone, but the facility with which they actually make "music" is more dependent on an inborn talent. I suspect there's a similar effect with high speed Morse.

Some people's brains work in fundamentally different ways than other people's brains in how they organize and present information to the conscious mind. The grossest example of this is the difference between left handed and right handed people. The two hemispheres of the brain process information differently. Left handers usually have a more three dimensional spatial representation of meaning while right handers have a more verbal linear representation. This in turn allows left handers to process information presented in a parallel fashion more easily than in a serial fashion, and vice versa for the right hander. So left handers respond better to visual patterns presented as a gestalt while right handers respond best to serial linear presentations of stimuli such as simple repetitive sounds.

Of course there are also cross dominant individuals, and those who are ambidexterous, and literally billions of other differences. While there is certainly a good deal of common wiring in people's brains, else they wouldn't be able to communicate as well as they do, it's still true that each individual *is* an individual in the way his brain processes information. This is a case where one size definitely doesn't fit all, nor does one method of communications fit all.

: >If you learn code Farnsworth, you'll have a easier time upgrading.

: Hi Ken, I have a stupid question. Does anybody actually send Farnsworth-
: sounding code on the air? I've never heard it on the air and am wondering
: why learn sounds in a way that will not be encountered in operation?

: 73, Cecil, KG7BK, OOTC (Not speaking for Intel)

Cecil,
Actually, I think most people using higher speeds send using
"Farnsworth". If you compare, say, W1AW bulletin speed (sent I assume
at "normal" 20wpm), to what you usually hear in a 20 wpm QSO, it "seems"
faster. I tend to use longer spaces than I should, but not
intentionally...it just sounds better to me. But I was doing that long
before I ever heard of Farnsworth.

By the way, I think Farnsworth is a very good technique for improving
code speed. There is a distinct difference between the way one's mind
processes 5 wpm and 20 wpm...as a matter of fact, people who can copy
comfortably at high speed can have a heck of a time understanding
slow. Learning the _sound_ of high speed should begin very early in
the process.

I owned (and heavily used) one several years ago. Absolutely top-notch
piece of gear. I was told many times that the audio was "just like DDD").
The problem with patches is that once folks find out you have one, you get
hounded to death to make calls for them. I finally refused to run any
except for DX.

2375. need accessories for syntor X

Newsgroup: rec.radio.amateur.misc
Date: 1994-08-11 13:49:03 UTC
From: milcom@netcom.com
Message-ID: <milcomCuDIDr.MC0@netcom.com>
Source record: 261780

I have a syntor X 800mhz conventional. I'd like acessories so i can try
the dang thing. Its been converted to 900mhz.
I also have a few 900 spectra's. I need micro phones for them. It
has a ten pin square plug with a indent in the middle for the mic.
I'd really like to hear from anybody running on 900mhz and what they're
doing for trancievers. There are tons of stuff for the 935-940 trunking
band. I would guess if youre able to program the thing onto a
conventional frequency, then you could just change the offset oscillator
for the repeater split. I know somebody who can program the spectra to
the 902-928 range but the vco must be retuned for it to lock.
I have recently become motivated because the reset jamming our 1.2Ghz
receiver input is encountering.

For a great novel about the use of "we" in reference to an individual,
read _We the Living_ by Ayn Rand.

I know three hams who have the 22at and they all say that the lack
of a backlit keypad is the main drawback, otherwise they love 'em.
It will work for packet, but keep in mind that under any high-power
high duty cycle ops, the rig will get VERY hot. run as little power
as you must to make a good packet contact, and your rig will thank you.

you may want to check out the yaesu mini 2m ht (ft11r??) as i have
heard nice things about them as well

>
>You are correct, sir, but the original post implied to me that there
>was not a regular repeater involved (2m simplex was mentioned).

True, although using it as a repeater extender can also be very helpful at times (our club once had to set one up in order for operators sending traffic for firemen and policemen at a major fire downtown between tall buildings to be able to hit the repeater).

>The other vision is a single mobile x-banding with the "base" on
>one freq and the field guys on the other.

This is almost the scenario I had in mind. The field operators and the base would all transmit on one band and all receive on the other.

> Since the x-band radio
>transmits both ways, the same "WX2ABC repeat" tagged onto a call in
>either direction should also meet the requirements.

True, but it would still be nice for the operators not to have to worry about remembering to ID the repeater, especially in an emergency setting when you want to keep verbiage to a mininum.

> (Remote control of
>The Repeater is a whole other matter, but if WX2ABC just sat in the car...)

With the pizza and drinks, of course...

>Paul N6HCS
>carreiro@netcom.com
>N6HCS @ N0ARY.#NOCAL.CA.USA.NA

Glad you asked!

It all depends on what you require.

For example, HamCall by Buckmaster is tbe best if you
want to include DX callsigns. They have over 350,000
DX callsigns. HamCall is supported by the most number
of logging programs also. Buckmaster is also the most
expensive. From the manufacturer direct, HamCall costs
$55.00 shipped. From my company, Radio Devices it is
$41.95 shipped. HamCall has the best search utility.
The Folio search program lets you search the database by
any part of the record. A search for "gomer" produced
18 matches. The first was:

CALL SIGN: KB0KR
LICENSE CLASS: NOVICE
EXPIRATION DATE: 11/09/2003
YEAR OF BIRTH: 76
NAME: Qkinya D Harrison
STREET: 308 Gomer Rd
CITY/STATE/ZIP: Clarksville, TN 3704

None other has such a search mechanism that I've found.
The executable in the root directory for the SEARCH routine
is "ham.exe"

QRZ! from Walnut Creek runs a close second. The new
Summer release contains some DX callsigns, but not
nearly as many as Buckmaster. The Summer release
contains the May 1994 FCC release of the callsign

database. (I think that was the latest one). 3rd
party programmers seem to like interfacing to QRZ!
and it is alledgedley the fastest CDROM lookup,
although they are all under 2 seconds in my 1x cdrom
drive anyway. QRZ! is $34.95 shipped from Walnut
Creek, $24.95 shipped direct from the author, or
$21.95 from Radio Devices. QRZ! also contains a
very nice Windows interface to the callsign lookup.
Recently QRZ! has had a big following because of
the attractive price. You can buy QRZ! twice per
year for about the same price as 1 HamCall. Good
deal if you DONT want the extensive DX Calls.

SAM is another manufacturer of a callsign database
CDROM that sells for $39.95 I think. However, they
require their dealers to sign a statement saying they
will NOT discount the price. Since all of the CDROMs
have high margins, I try to sell for the lowest possible
price to keep in business, so I refuse to sell SAM.

Obviously the CDROMs have lots of other stuff the
manufacturers cram on there just because the space is
there. Some useful things you can find are shareware,
radio mods, and of course Usenet postings. HamCall and
QRZ! both are about 500MB total. QRZ! includes many .WAV files
so you can play and then hear what AMTOR etc... is supposed to
sound like. The best method to consume MB I have ever seen.

Just as an aside, Buckmaster also publishes the Electronic
Software Compendium CDROM which has exclusively shareware,
demos, radio mods, etc... The shareware on the HamCall is a
subset of this ESC CDROM. The ESC is $30.00 from BuckMaster
and $24.95 from Radio Devices.

Again, let me emphasize all prices I mention in this posting
include shipping. (Buckmaster and Walnut Creek also include
something they call Handling)

CE>Hi Ken, I have a stupid question. Does anybody actually send Farnsworth-
CE>sounding code on the air? I've never heard it on the air and am wondering
CE>why learn sounds in a way that will not be encountered in operation?

The reason is that nearly all electronic keyers are not designed
to send code that way, though there are a few. As you probably
have been told, Farnsworth code is meant to force learners to
recognize a character by its complete sound and not by counting
dots and dashes. As your speed comes up you will eventually be
sending/receiving code in the 15 to 20 wpm range and that matches
Farnsworth character speed.

The Supermorse program for learning code does use the Farnsworth
method.

Now for a newbie question. What is "Farnsworth"? I am very confused
as to how something can be 5WPM _and_ 16WPM at the same time. I am
thinking
of getting a tech plus and looking into learning CW.

How do I learn code Farnsworth?

2390. Commercial Radio Telegraph License

Newsgroup: rec.radio.amateur.misc
Date: 1994-08-11 15:49:52 UTC
From: ys@isr.harvard.edu
Message-ID: <32dhb0$pv@scunix2.harvard.edu>
Source record: 261835

I got so many good suggestions about how to improve my CW speed, so I decided to ask for another help. I am trying to get a commercial radio telegraph license. I understand that this is a usegroup for amateur radio, but I could not find any other group appropriate for my question. Please send your advice to my E-mail address: ys@isr.harvard.edu. It is probably not a good idea to discuss commercial radio license extensively in this forum.

I am trying to get second radio telegraph license (T-2) from the FCC. For this license, I have to pass Element 5 (radiotelegraph operating procedures and practices) and Element 6 (advanced radiotelegraph operating procedures and practices). Does anyone know any study material (NOT question pools) for these two elements? The question pools of these two elements have been just released by the FCC, so I know that there are no study guides yet that will explain every single question of the question pools. I am hoping, however, that I can probably use any study materials for "old" elements 5 and 6 to some extent if any such materials exist. By "old" elements 5 and 6, I am referring to exam elements before the FCC delegated the licensing exam to the COLEMs (Commercial Operator License Examination Managers). If anyone knows any such study materials, please let me know.

I do not have any strong background in electronics, so I am afraid that it will be tough to study question pools without any study materials. Besides, Element 5 will have at least 500 questions in the question pool. I only need to take Elements 5 and 6 for T-2 because I have Amateur Extra and a few other commercial licenses (GROL, GMDSS/M, GMDSS/O, and Ship Radar). I found that the questions and answers provided by the FCC have many errors, and it is very frustrating to study the question pools without any additional materials because sometimes I do not know which answer is "really" correct! If anybody can suggest any materials, I will be truly grateful.

Message-ID: <9408111608.AA16948@nms1.abb.com>
Source record: 261842

Hello,

I am thinking of using my Kenwood TS-140s with a
transverter for some of the UHF/VHF bands. I am
considering the Down East Microwave models, but
I think they require separate RFin/ RFout lines
on the "host" rig.

I am pretty sure that the TS-140s does not have
transverter input/output lines. Has anyone had
experience with transverters and the TS-140s?

Is there an outboard circuit that can be used to
switch between input and output and antennuate
the tx output to mV levels? The TS-140s has a
12v 10ma "TXing" signal avaible. Is there a
commercial product available that switches and
antennuates?

I would appreciate any information you could give
me on this topic.

Thank you,
Bill Rogers KA2CKI

Cecil--
(a) Yes. Particularly if the keyer's set for 30 wpm and you answer
somebody sending around 15, it's easier just to leave bigger spaces between
characters than to fiddle with the keyer adjustment. Spacing is also a way
to emphasize something, particularly if you're using one of these
new-fangled electronic things, rather than a mechanical bug or straight
key, where you vary the "weight" within a character.
(b) What you're learning is the _sound_ of the characters at a brisk
speed that you will use later. Farnsworth spacing merely gives you
additional processing time during the learning process. As you improve,
you reduce the spacing until finally you can copy the desired speed with
standard spacing.

>
> Scott

Scott: I assume you are asking about a DX QSL service and not the QSL bureau system.

A QSL service takes your outgoing cards and forwards each card to the appropriate place for confirmation (via manager, bureau, etc.). There is a cost per card, but that is determined by the QSL service. The N7RO QSL Service just went out of business this month, but was picked up by Les, WF5E. Write to Les and ask about his service and cost per card.

>I was able to make 6 states and 2 countries on 10 meters (not very
>good I admit but time was a limiting factor).

Well, I don't know how the overall propagation was in YOUR area,
but in west central Indiana (at least from my perspective) it sucked
most of the time. Friday evening at the start of the contest, the
band opened up with some short-to-medium skip for a few hours, and
likewise on Saturday evening. It was dead all day Sunday and
for me never did open up before OR after the contest closed down.

All told I had 32 QSO's.....but then peaking only 10 watts,
with a down band and competing against guys running 100, 200 and
in some cases considerably MORE watts I don't *expect* to win. :-)

And considering that for me the band was only open for a total
of about 8 to 10 hours instead of the whole 48 hours of the contest,
I suspect that there will BE many low scores.

It put me that much closer to my 500 bar and VP number, for
one thing. I was hoping to get the right short skip to pick up
Illinois and Michigan, all I need for my 10-10 WAS. That didn't happen,
but I *did* get some more #'s from states I don't usually hear, like
Minnesota, North Dakota, South Dakota, Wyoming and some up the eastern
seaboard. Last night there was a bit of opening, and I also picked up
a Nebraska station and an OM/XYL team from Rhode Island. Neither of
those states do I hear commonly from my QTH.

>I would like to join the 10-10 club. I need to send my 10-10 log to the
>area 4 coordinator but don't know who it is. I would appreciate any other
>into that you might have to pass along as well.

I don't happen to have my current newsletter here at work, so
I can't answer with info on who the 4th Area Manager is, or the
address.

All you need to join are 10 10-10 numbers. Make your list
including the callsign, 10-10 #, state, and name of the station/operator
you worked. For the initial list, I don't think you need to
have them in order by 10-10 number, but if you start participating
in the bar program (multiples of 100 contacts) they want them ordered
by the 10-10 number.

I keep thinking that current US membership dues are $7 per year
but I might be out of date on that.

BTW, there are several hams on the internet that have expressed
interest in having a subset of rec.ham-radio with a group name
something like rec.ham-radio.tenten.....but, none of them are in
a position to assist with the required steps it takes to create
such a group.

If I can find someone to help, we will have a group that will
make it easier for "ten-ten members on the internet" to exchange
information without all the QRM/QRN of a larger group.....

2399. PKGOLD packet problems

Newsgroup: rec.radio.amateur.misc
Date: 1994-08-11 17:18:55 UTC
From: ranger@eskimo.com
Message-ID: <CuDs3p.HwD@eskimo.com>
Source record: 261783

I have ran into a problem with the latest version of PKGOLD
Enhanced with Pactor. It seems to exit the program with the
following:

DISK ERROR 100
DISK READ error
record -1 in GOLD.BD

This is found on the screen after the program dumps out. Timing of
the exit from the program is random meaning 5hrs or 1hr after loading
the program and has even done it while in the connect mode as well.
It will leave the TNC open so that the buffer fills up and no connects
can happen. Having the ***SAME*** version for the Kantronics TNC
(KAGOLD) for use with the KAM+ and the KPC models and using the
SAME computer ***WITHOUT*** ONE problem at any time and I can
leave it without worry PKGOLD I can not do that at all. (also tried
it on other computers with the same results)

One other problem I have notice is that opening a connect window it is
full of junk chars which should not be there. ?????????? (PKGOLD ONLY)

Interfex claims it doesnt have any problems and thinks it mine. Why
can I run the same versin for the Kantronics TNC without any problems
but yet I can not run the PKGOLD (extra cost) with the AEA products.
(PK-232, PK-88, PK-96)

Also how many commercial programs leave out the manual because you have
it with your other versions of gold

Has anyone seen or have the so called DUALPORT PKGOLD yet.

Won't the users of services provided using these frequencies have to pay off this 600 million dollar loan with interest in the form of hidden user fee taxes when the cost is passed down, sort of a "trickle up" monetary policy.

2401. Temperature Telemetry

Newsgroup: rec.radio.amateur.misc
Date: 1994-08-11 17:22:34 UTC
From: oflber02@uctvax.uct.ac.za
Message-ID: <1994Aug11.192234.1@uctvax.uct.ac.za>
Source record: 261862

I am currently doing a thesis on a Perishable Goods Temperature Monitor.
The thesis calls for a temperature probe which is packed with the goods.
An interrogator then interrogates the probe and a reading is given.
The problem is that the probe is not allowed to have a power source at all.
The interrogator is hand-held and is powered by a battery. An option is
to have a rechargeable set up.
The probe must be as light as possible and as small as possible.
The system must be able to read temperatures between 233K and 313K
with an accuracy of 0.5K
I have thought about using a telemetry system or a transponder.
I have thought about using magnetic, acoustic, RF or microwave coupling
but I do not think I will be able to get enough power from a meter away
to power a IC like the LM35.
The interrogator must be able to receive the temperature from a meter away.
The only thing I have thought of that might work is an oscillating circuit.
The oscillation frequency changes with temperature.
A dip meter is then used as the interrogator.
The only problem is that the only thing I can think of that will vary with
temperature is a bimetallic strip.
The strip can then be used to change the capacitance of the oscillating
circuit.
However I need a circuit for a dip meter which can constantly scan the
frequency range and be able to differentiate the dips so that the required
accuracy is obtained.
Any help or ideas and suggestions are needed and very welcome.
Please send mail to
oflber02@Uctvax.uct.ac.za
Thanks in advance

: > If you learn code Farnsworth, you'll have a easier time upgrading.

: Now for a newbie question. What is "Farnsworth"? I am very confused
: as to how something can be 5WPM _and_ 16WPM at the same time. I am
: thinking
: of getting a tech plus and looking into learning CW.

: How do I learn code Farnsworth?

For a given code speed, the spaces between words, between letters, and between dits and dahs are specifically defined (don't have the actual timing ratios available right now). The Farnsworth method simply uses extended letter and word spacings while maintaining the dit-dah spacings within each letter. In other words the letter is sent fast (so you can learn the sound of the letter at high speed), but you have more time between each letter and word for the "translation" process which is necessary while you are learning the code. When you become proficient, there is no conscious translation (similar to fast touch-typing) and the extra time is not needed. If you are interested in the exact timing units for CW spacing, I'm sure someone has that info handy.

Some people _do_ have trouble learning code, but do not let the discussions here on internet scare you. No one needs a pre-conceived mental block! You may find it fairly easy, and you may enjoy it. Regardless of the arguments against it (valid or otherwise) it is EXTREMELY rewarding to develop this kind of skill and use put it to use. Give it a try! You can pass the 5wpm with very little effort, but to really enjoy using code, you must be fairly fast and proficient...and that does take time.

>Hi Ken, I have a stupid question. Does anybody actually send Farnsworth-
>sounding code on the air? I've never heard it on the air and am wondering
>why learn sounds in a way that will not be encountered in operation?
>

Not a stupid question. When I do get on HF, I do send something
akin to Farnsworth, probably something like 10@18. It may be me
personally, but I can key much better at a high dit rate (i.e.
a better fist) than at a low dit rate. The majority of hand
keyed code out there is horrible (sending exam anyone?), but the
electronic keyers at least force people to have the right dah/dit
ratio.

As far as learning the code, you want to learn the sound, so if you learn
5@16, then going to 13 (either 13@13 or 13@18 as on the ARRL exams), the
majority of the work is learning to narrow the gap between the letters,
not relearning how the letters sound.

Of course, if the goal is just to pass the 5, then some people may
find it easier to just do a mental translation of the dits and dahs
into letters -- they will hit the plateau at 10.

OK, folks, here is the weekly posting for the CWISTS.....

This week I will continue with a very rudimentary attempt at stringing it along somewhat like an informal net, so that we can maximize the number of folks wanting to join in in some 'semblance of an ordered sort of manner.

Last week worked out pretty well on 80 meters, stations all up and down the east coast through to the midwest were heard. Even some QRP checkins were there.

73 TU SU DE NA4G BOB AR

Greetings CWISTS, Boatanchorites, Fellow Hams, et al:

I will be on again at 0400UTC for the continuing saga of the Sacred and Most Honorable Friendly Society of Brass Pounding Fist Functioning CWISTS.

Someone needs to scout out a good QRG in the 40 meter novice band that is not smack in the middle of the packet racket. The racket does not bother me, but it can be rather intimidating to the ears for the new folks aboard who have not had the time on the air to develop that grey matter filter that the Old Timers have, after eons on watch at

the key. The fine tuning of the ears takes a goodly number of practice runs to get the QRM filtered out, as all the old hands aboard can readily attest.

There has been a lot of interest on the rec.amateur.radio newsgroups on sending CW and the general poor quality of many fists these days. Let us do a little to promote, not only the art of receiving CW radiotelegraphic communication, but also the art of ...sending... good CW radiotelegraphic communication. It is perfectly fine to have an individualized fist, and it is often easy to tell who is aboard on watch at the key, just by the first few characters received, but it ...should... be a point of pride and operating skill to be able to manually send characters of sufficient integrity as to be readily received by all who might be in a position to hear same.

So, let us all see who will be on watch this coming friday night (saturday morn 0400UTC). Run your treasured boatanchor if you can, or even that newfangled rice box supreme, or even that fine homebrew QRP rig.

Definition: A CWIST is a person with an active interest in the PRACTICE and USE of continuous wave radiotelegraphy as directly is appliccable to amateur radio. Such PRACTICE and USE may take the form of learning about radiotelegraphy and its history in amateur/commercial areas, its application to radio telecommunication, the practicing of the art and craft of radiotelegraphy, and the refining and developing of the technology of radiotelegraphy.

The general information is:

```
++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++
+ CWISTS Friday Night Fist Function +
++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++
+ +
+ Standard time: Friday Nights at 0400UTC (Saturday morning) +
+ +
+ Standard freq: 80 meters --- 3702.5 khz for all hands. +
+ 40 meters --- 7102.5 khz alternate, for all hands +
+ (between the heterodynes) +
+ (someone scout out a better QRG) +
+ ___ +
+ Standard calling signal: CWIST IMI DE <yourcall> K (if there +
+ are no control stations calling for +
+ you to check in), or, +
+ CWIST DE <yourcall> K (if there is a +
+ control station inviting checkins) +
+ +
+ Note: A simple informal net style protocol will generally be +
+ used, unless no control station assumes control for the +
+ evening, in which case it is an open roundtable format +
+ discussion group. +
+ +
```

++

Let us all work together to continue to advance and promote the friendly use of CW on the amateur radio bands.

Let us continue to assist and help the newcomers and slowspeeds who are trying to get their CW going.

Let us to continue to promote the use of whatever gear you have up and available, be it the newest of sorts or the oldest boatanchor. Remember, CW generation has not changed since the days of arcs, Alexanderson alternators, and Pliotrons.

Let us continue to promote the sharing and fellowship of the history and traditions of amateur radio (this includes all you OTs out there that have all sorts of goodly tidbits of history to relate to the young squirts on the block, and it includes all you young squirts on the block who, even though a bit new at CW and radio are the future of the service or hobby or profession).

Let us continue to promote the ``elmering'' of all of our new folks by the old timers aboard, in any way that we can. We should not be out to convert the brethren to CW, but should be there to elmer them and assist them in learning/practicing their skills, if possible.

So, OTs aboard, young squirts in the wings, high-speed afficionados of the art, and slow-speed ragchewers, join in on the fun. If your equipment is old boatanchor, so what. If your signal is a bit weak or chirpy, so what. If your antenna is just a mere piece of wire up into the trees, so what. YOU can still join in and participate.
YOU are the folks who will make it what it can be, a goodly learning time and an enjoyable evening for all.

See You There OM/YL.....

73 TU SU SK DE NA4G
Bob

2406. GB2RS News 14th August 1994

Newsgroup: rec.radio.amateur.misc
Date: 1994-08-11 17:57:09 UTC
From: dave@llondel.demon.co.uk
Message-ID: <776653029snx@llondel.demon.co.uk>
Source record: 261865
Cross-posted to: uk.radio.amateur,rec.radio.amateur.misc,rec.radio.info

Good morning. It's Sunday the 14th of August and here is the GB2RS news broadcast, prepared by the RSGB and intended for all radio amateurs and short-wave listeners.

First this week's headlines:

The RSGB has details of many RAE, Novice and Morse courses,

A QSL Manager has been appointed for the new G0 Victor series,

And a more stable conditions are predicted for the HF bands.

This time of year sees the start of courses for the Radio Amateurs Examination and for Morse training. For RSGB members, lists of courses are published in the August and September editions of Radio Communication, but there are too many courses to list on GB2RS. Anyone wanting to join an RAE or Morse course, can call RSGB Headquarters on 0707 659015 for details. Full information is available on Novice courses, too.

Now that the Class A licences have reached the G0 Victor series, an RSGB QSL sub-manager has been appointed to handle incoming cards. He is Mr R C Powell, G4VAA, and his address is: 11 North Park, Fakenham, Norfolk, postcode NR21 9RG. Full details of how the RSGB QSL Bureau works, and how to send and receive cards, can be found in the RSGB Call Book, or will be sent to you on request if you call 0707 659015.

The RSGB Liaison Officer for the West Midlands, Tony Faulkener, G0SKG, has a new telephone number. RSGB members in the West Midlands who require advice or assistance can now call him on: 0384 820616.

The South Glamorgan UHF repeater, GB3SG, has closed down from its site near Cardiff and will be of until a new site is approved. Enquiries should go to the repeater keeper, Roy Selleck, GW0JZR, whose address is correct in the RSGB Call Book.

Now some items of HF DX news from the weekly RSGB DX News Sheet which is edited by Brendan McCartney, G4DYO.

From the Ivory Coast, K4ZLE, expects to be operational from next Thursday the 18th for four days, and for a further four days from the 23rd. The callsign is not yet known.

From Monaco, 3A/W5ZPA will be active from Tuesday the 16th for five days running 100 watts to a vertical.

And from Vietnam, JA1IED hopes to be on the air about now using a 3W6 prefix. Frequencies to check include: 14,013, 14,240, 21,010 and between 21,150 and 21,200 kHz.

We know of two rallies taking place today, Sunday the 14th of August:

The Derby and District Amateur Radio Society Radio Rally is held at Littleover Community School, Littleover, Derby. This is on the A5250, just north of its junction with the A38. The event has the usual attractions including a monster junk sale.

The Flight Refuelling Amateur Radio Society Hamfest is at the Flight Refuelling Sports Ground, Merley, Wimborne, Dorset. Doors are open from 10am and the event features trade stands, a bring and buy stall and a car boot sale. Also on display is the G4RFR 10GHz EME station. Talk-in is available on 2m, channel S22.

Next the three events we know of for next Sunday the 21st of August:

The Great Eastern Rally is to be held at the Cattle Market, Hardwick Narrows, Kings Lynn. The market is located just off the A10, at its junction with the A47. Doors open at 10am, or 9.30 for disabled visitors. The event features trade stands and a bring and buy stall indoors, and a car boot area outside. Refreshments will be available. The site has easy access for the disabled as it is all on one level. Details from Ian, G0BMS, on 0553 765614.

The Southend Rally will be at the Rocheway Centre, Rochford, Essex. Doors open at 10am. The event features trade stands and, weather permitting, a boot sale for radio, computer and electronic equipment. Talk-in will be on channel S22. Details are available by telephoning 0702 353676.

The West Manchester Radio Clubs 'Red Rose' Rally is to be held at the Bolton Sports and Exhibition Centre, Silverwell Street, Bolton. Doors open at 11am, or 10.30 for disabled visitors. The event features over 70 trade stands, society stands and a bring and buy stall, all at pavement level. Refreshments will be available all day. Details from Dave, G1IOO, on 0204 24104, evenings only.

Now for the HF contest news:

The European DX CW Contest is taking place this weekend and finishes at 2400 tonight, Sunday the 14th. Operate on HF bands, 3.5 to 28MHz, excluding the WARC bands and obeying IARU Region 1 band plans.

The South-East Asia Net DX SSB Contest is next weekend, from 0001 on Saturday the 20th until 2359 on Sunday the 21st on 1.8 to 28MHz, but not WARC bands. For further details see July RadCom page 19.

Next some VHF contest news:

The RSGB 24GHz Summer Cumulative Contest takes place today, the 14th, from 0900 to 2100 UTC. See April's RadCom page 82 for details.

The RSGB's 432MHz Fixed and Listeners Contest is next Sunday the 21st from 1700 to 2100 UTC. There are three sections, Single Operator Fixed, Others Fixed and SWL. See May RadCom page 79 for further details.

Special event stations active this week include:

GB4ASH at the Ashfield Show, Sutton-in-Ashfield, today, where the Mansfield Amateur Radio Society will be on the HF and VHF bands, CW and SSB, plus packet on 2 metres. Visitors are most welcome.

Also today, G2TV, will be activated by members of the Baird Amateur Radio Society to commemorate the 50th anniversary of the first multi-gun colour television tube.

From now until Wednesday, GB4ATC celebrates Flight Activities Week at the RAF Museum, Hendon, in London.

Next weekend, the 20th and 21st, GB50DD will be at the P L U T O Show at Lepe Country Park, near Calshot, Hampshire. Operation by members of the Horndean and District Amateur Radio Club will be on HF CW and SSB, plus VHF, all weekend.

Also next weekend GB2HP will be activated by the Paisley (YMCA) Amateur Radio Club from Holyrood Palace, and GB800DON will be on from the Doncaster Show.

Next, here is the solar factual data:

First the good news that the telex service has now been restored we are once again able to bring you the full data on GB2RS and via the RSGB Propagation Studies Committee packet propagation data service.

The period from the 1st to the 7th of August has seen solar activity at extremely low levels. On the 1st there were 3 sub faint flares - these would normally not be reported - and on the 4th there was one spotted region on the disc made up of 11 very small spots. Geomagnetic activity has declined to 'very quiet'.

The sunspot indices have been very low every day with the mean for the period being only 22. Solar flux levels have hardly changed, averaging 75 units. The 90 day flux average on the 7th was 79 units.

The geomagnetic Ap indices have also been very quiet, averaging only 3.7 units, with some days being down to only 2 units. The state has been 'nil, nothing to report' all week. The daily aa indices, as supplied by the British Geological Survey for the 26th of July to the 1st of August, gave an average of 19.4 nanoTeslas, about K2, with periods down to only 5 nanoTeslas.

The X-Ray flux has remained low with the period averaging A2.6 units, though levels ranged from A3.4 down to A1.5, which is very low. The electron fluence levels which have been very high for some months have at last declined to near normal; this should improve the stability of the HF bands.

I'll repeat the figures. Spots - 22; Flux - 75; Ap index - 3.7; X-ray flux - A2.6.

Now the ionospheric data for Central France:

The F2 daytime critical frequencies at Poitiers, as reported by Meudon, have increased almost every day from 6.4MHz up to 7.1MHz by the 7th August, giving an average of 6.8MHz for the period. The darkness hour lows averaged 3.1MHz. There have been many periods of blanketing E lasting up to 4 hours at times and some spread F. The highs are now about 20.00 hours and the lows at 04.00 hours.

I'll repeat the figures. Highs - 6.8MHz; lows - 3.1MHz.

Now the ionospheric data for the north:

The F2 daytime critical frequencies at Ekaterinberg averaged 5.8MHz. The darkness hour lows have been affected by blanketing E, preventing readings at times but would appear to have been about 3.5MHz.

I'll repeat the figures: Highs - 5.8MHz; lows - 3.5MHz.

And lastly the solar forecast:

This week, the quieter side of the sun will be in view. Solar activity is expected to remain at very low levels. Geomagnetic activity is expected to be quiet up to the 19th, when levels could increase to unsettled. Ionospheric MUFs in the south are expected to be about 20MHz during daylight, and about 12MHz for the darkness hours. Northern levels will be down on this; north/south paths will be the best.

And that is the end of the solar information.

Finally in the main news, SSL has informed the Society that as of last Wednesday morning, the latest callsigns issued were in the G0 Victor Delta and G7 Tango Hotel series, and Novice calls in the 2 0 Alpha India and 2 1 Delta Golf series.

--

GB2RS is prepared by the Radio Society of Great Britain and is broadcast in the 80m, 40m, 6m and 2m bands.

If this is a repost, sorry. I'm having difficulty with my e-mail editor.

I'm in need of the extended RF mods for the Kenwood TM-733 dual-band mobile radio. Also, any technical or operational tips. Thanks.

Cross-posted to: rec.radio.swap,rec.radio.shortwave,rec.radio.amateur.misc

Deal fell through on the sale of these brand new never out of the box Solarex MSX 83 solar panels. Here are the stats on these panels:

Max power 80.8 watts
Open circuit 21.4 volts
Short circuit 5.26 amps
Voltage @ load 16.8 volts
Current @ load 4.8 amps

The panels are L44xW26xH2" and weigh 15-20# each. They are polycrystalline cells with an aluminum and plexi-glass frame that makes them totally weatherproof. I paid $500.00 each four months ago and will except fist bid over $300.00. I'll split shipping costs which when I received them from UPS cost $25.00 total. These are excellent panels that I believe were rated at close to 18% efficiency.

contact me at e-mail bruner@netcom.com and address it to Dan

Thanks

Well, you are going to die, -- someday. Maybe not from RF radiation
hazard, but then again a truck might run you down before you discover
that nonoperable brain tumor.

Anyway, here are some numbers that might make you feel better.

From "Electric Field Levels Around a Typical Amateur Radio Station",
a paper presented at the 1992 IEEE EMC Symposium.

The author made many readings around his home while operating
his station at 100 and 500 watt levels. The highest readings were
on the order of around 30 Volts/meter with most of the readings far
below that.

ANSI C95.1 suggests the following limits for human exposure to RF:

7 MHz 270 Volts/meter
14 MHz 135 Volts/meter
21 MHz 90 Volts/meter
28 MHz 67 Volts/meter

Most amateur stations are well below these limits.

I wouldn't worry from the looks of some of the fellows I see at the ham
meetings non ionizing radiation isn't a problem unless it causes
artheriosclerosis, hypertension, and a host of other sedentary lifestyle
health problem.

>Howard

.....well here in Ol germany I know of two sites where you can drive your car a way direct under the antennas of a) a 750 kW longwave transmitter (actually working with *only* 250 kW and b) a 100 kW UKW transmitter. Maybe next time I go there, I will try to rent a Toyota and see what happens.... As far as I know, at none of the sites was a traffic sign NO TOYOTAS or similar :-))

But when the first ABS systems came up, I was told that more than one people drove their car with blocking wheels straight in the fields under the UKW antenna because the ABS processor got a little bit confused (in spite of all that shielding cabinet of steel and plastic). Nowadays systems seem to cope with the problem (especially BMW had some problems when they started to electronialize their cars but fixed them very fast - must have been a nice time for their engineers :)))

> How do I learn code Farnsworth?

Morse Timing is dictated by something known as Character Speed
(a.k.a. dit rate), and overall sending speed.
The "standard" dah/dit ratio is 3, and inter"bit"
spacing is a dit; interletter spacing
is considered to be a dah or 3 dits, and the interword
spacing is supposed to be 7 dits.

The "standard" Morse word is PARIS (.--. .- .-. .. ...)

(apologies to those who hate "reading" code, like myself)

PARIS has 4 dahs, 10 dits, 9 interbit spaces, 4 inter-char spaces
plus a inter-word space (7 dits), or
12+10+9+12+7 = a total of 50 dits. So, 5 WPM would be the
same as 250 dits per minute, and 13 would be 650 dits per minute
and 20 WPM would be 1000 dits per minute.

The problem with the "standard" method of sending code
that way is that the letters sound different when
sending at 5 vs. 13 WPM.

Farnsworth is a method where the INTRA character dit rate
(i.e. the length of a dit, dah and interbit spacing) is
sent at a higher dit rate than the INTER character dit
rate.

Example: 5 WPM@16 WPM

This means that the spacing inside a letter is at 16 WPM or a dit rate of 800 dits per minute, while the spacing between letters and words is slowed so that the average dit rate is 250 dits per minute. This has the effect of really lengthening the space between characters and words while keeping the "sound" of the character intact.

(In the above example, 31 of the 50 dits of PARIS are sent at 800 dits/min, while the remaining 19 dits are sent at 117.83 dits/min)

It also discourages learning to dissect the character into individual dits and dahs and translating them which works at 5 but fails around 10 WPM. Learn the sound instead.

The same can be done for 13 WPM (typically done at 18 WPM Farnsworth).

> How do I learn code Farnsworth?

Hi Davin,

I'm sure many answers will accompany this one. This answer along with all the others should give you a clear idea what this method is.

The Farnsworth method of learning code involves spacing and character speed. If you sent a 5WPM character {the letter "A"} [diiiit daaaaah] at a 5WPM spacing [approximately two seconds between characters] and then sent that same character again you would have...well....5WPM at a 5WPM spacing. Sounds like, diiiiit daaaaah --one-thousand-one one-thousand-two-- diiiiit daaaaah. But, let's say you sent an 18WPM character [Dit dah instead of diiiit daaaaaah] at a 5WPM spacing: dit dah --one-thousand-one one-thousand-two-- dit dah; the character, itself, sounds faster but you still have that approximate two second spacing between each character--and now the spacing seems longer. The faster the character speed the longer the spacing seems. Kinda like it gives you more time to figure out what the sent character was.

The actual goal is to not have to think about it as you decode each character. Kinda like learning another language. That only comes with practice and eventually you will be hearing whole words and not just characters. That's down the road apiece for a beginner though.

Good luck if you decide to go for it. It's not really as bad as *some* are making it out to be. And please don't judge ham radio by what you may read on your monitor's screen. You have to try it out for yourself and make your own decision on that. Don't let a few naysayers make that decision for you.

>Hi Ken, I have a stupid question. Does anybody actually send Farnsworth-
>sounding code on the air? I've never heard it on the air and am wondering
>why learn sounds in a way that will not be encountered in operation?

Well Cecil, Farnsworth is just a method designed to help people increase
their speed once they learn the code. Once it is learned at 5 WPM you
basically are supposed to know it at 17 WPM too. As you probably know
the characters are the same just the spacing between characters/words
changes. As for people sending "Farnsworth" on the air, don't worry
about it. Just work on sending it the Cecil Moore way.

I had recently tested one for a Ham magazine.. GREAT.. is what I say and can't wait for the CW accessory

==========

MFJ-9420 20 Meter SSB Travel Radio-Review
By Jeff M. Gold, AC4HF

Every once in a while a new product comes along that is just different enough to put some spark back in the hobby. When I saw the advertisement for the new MFJ twenty meter travel radio I couldn't wait to get my hands on one. Twenty meters is my favorite band and I have had a great deal of success using low power on this band with CW and SSB. The MFJ CW QRP rigs got me started using low power. My hopes that this new product would get me more excited about working SSB.

The first thing the receiver must be able to do is hear the signal (sensitivity). The MFJ-9420 uses a single conversion superhet design. The transceiver employs audio-derived AGC. I found that the radio had a crisp pleasant sounding audio and was able to hear anything my main station transceiver could hear. The rig covers 14.150-14.350 without the optional CW module. The CW modules adds 14.000-14.100.

The second important receiver function is to be able to separate out the desired signal from other signals and noise (selectivity). The MFJ employs a tight eight pole IF ladder filter that is quite effective. Under normal conditions the rig has no problems at all. Under contest conditions it did well but is not

really designed for this type of activity.
A minor complaint about the MFJ CW rigs was their weak audio. MFJ used a Philips BTL audio chip and a 3&#65533; speaker in this new SSB transceiver. The audio is rated at greater than 1 watt output into an eight ohm load. I found the audio to be more than enough. Under most conditions I found I only had the audio level up to about 1/6th. The receiver draws about 50-100 mA which doesn&#65533;t put much of a drain on a battery.
The transmitter needs to be able to get your signal out and have the audio sound as natural as possible. The manual explains that the radio has a constant current speech processor. The manual explains &#65533;your MFJ-9420 features a very potent speech processor. PLEASE RESIST THE NATURAL TEMPTATION TO SHOUT OR CLOSE-TALK THE MICROPHONE IN ORDER TO BE HEARD! Instead, hold the mic about 2&#65533; away and speak normally.&#65533; On my first contact looking at the small rig on top of a number of much larger rigs, I found myself with the microphone up close and talking louder than normal so that my small signal would become bigger. The ham on the other end said &#65533;you&#65533;re plenty strong, but it sounds like your are swallowing your mike, back away from your mike and don&#65533;t shout.&#65533; I was somewhat embarrassed, but did as he suggested. He came back and said &#65533;good quality audio and an nice signal.&#65533; The transmitter draws about 2.2 amps peak at 13.8 volts.The rig I tested put out 12 Watts on my audio peaks. The rig will tolerate VSWRs of 3:1 or less.
The front of the transceiver houses the VFO which has a 8:1 reduction-drive with ball bearings. It is smooth and I had no problem adjusting the rig to bring in stations even under crowded conditions. The rig comes with a lighted analog meter. The meter acts as a S-meter in receive. I checked it against my commercial rig and found the readings to be very reasonable. In the transmit position the meter monitors the processor. It is a good idea to keep an eye on this till you get use to the rig. It is very useful. I found in every case that I was in the designated range on the meter, I received glowing audio reports. The rig has an a push button on/off switch, a push button tune switch which is useful with an antenna tuner, and both power and transmit lights as well as a volume control. The MIC jack is a 5-pin Din for connection with a Dynamic microphone. The jack will accept a standard Radio Shack 274-003 plug.
The rear panel has a standard SO-239 jack for the antenna. The power jack is a 5.5mm OD, 2.1 mm ID which accepts standard plugs that can be purchased at Radio Shack. There is also a Mic gain adjustment. The manual explains that you may have to turn down the mike gain if you are operating in noisy conditions that would require you to reduce the background noise (Field Day would definitely qualify). I did not need to adjust this under any of the more normal conditions under which I operated it. There are two additional holes left for the plug in CW adapter. One of them

is for the push button switch and the other for the key. This module wasn't available at the time I tested the rig, but I am looking forward to testing it out. I like 20 meters a lot and having both CW and SSB capabilities in a small portable rig would be a big plus to me.

The rig is very small and light. It is the same size as their CW QRP rigs and operates easily off a Gel cell. I used a 4ah gel cell for a long period of time without any difficulty. If you are planning on operating from hotel rooms or other places where power is available there is an optional AC portable power supply available. This rig and accessories can easily pack into a small airplane carryon bag. I plan on packing the rig, a small gel cell, battery charger and a 20 meter dipole in a carryon bag for a trip to Arizona this summer.

I first plugged the rig on my station test bench in my ham shack. I like to test rigs out under conditions where I can easily make side by side comparisons. I currently have nine separate transceivers hooked up and can easily switch between them. I find that although the specifications on receiver and transmitter performance are nice for comparisons, I prefer on the air testing. It is important to me that a rig perform well under many different conditions. I typically spend time ragchewing, contesting and portable before I form an opinion about a given radio. I tested the MFJ-9420 with the matching microphone. I strongly recommend the combination. I was very pleased with the nice feel of the matching microphone. On the air audio reports consistently confirmed the combination does a great job.

I don't think I ever had as much fun testing a new piece of equipment as I did with this rig. I didn't set any expectations about how the rig would perform. The rig doesn't have a lot of bells and whistles, such as memories, but this makes it the easiest to use SSB rig I have come across. My first contact was with Frank W6AIY. He reported that the audio was solid and very good quality. Mike, KD1QR, said "Read about that rig and more impressed now that I hear the audio."

I started to get excited about what the rig could do. I made up a cigarette lighter power cable and stuck my 20 meter ham stick on the back of my convertible which was still in my car port. I heard someone calling CQ. Lou, KC2LL, told me that the rig had great audio, good solid signal and stated "can't believe how well you are doing with low power and a Han Stick antenna"

My next phase of testing was to see if I could get anyone to hear me during the CQ WPX. I find the big contests are a tough test of any rig. I managed to make quite a few contacts. At one point I heard a big pileup on TM1C. I gave him a call. We exchanged contest information and I snuck in the comment that I was working low power on a new MFJ rig. He cam back and ask me if I really said I was using low power. When I affirmed that I was he said "unbelievable, you are stronger than the rest." I have

to admit I am using a good 5 band quad which helps a lot, but during these contests most of the other stations are using bigger antennas and a LOT more power.
The other evening I had a friend over working on a beta version of a CW QRP rig. I always turn one of my rigs on as background music. It was late in the evening and I decided to see if 20 meters had any life at all. We heard a BIG pileup on V73C. I tried to get him a number of times with one of my older rigs and about 50 watts. I was not successful. I decided to play around and turned on my Kenwood 850S. I was able to get through after a couple of calls. On a whim, I turned on the MFJ to the same frequency and gave the mike to Conard, WS4S. He called and was able to get through on the first call. It could have been his experience as an ham operator, but we where both standing around with shocked looks for a while after he made the contact.
I have operated the rig from my shack, and with a portable vertical made from PVC as well as using my ham stick in my car (not mobile). The rig has been used for long rag chew sessions as well as just playing around the band. During the testing period I gathered a number of quotes from people commenting on how good the audio quality is.
The transceiver was designed as a small, portable travel rig that would be rugged enough to take on camping trips and other portable use. The rig was not meant to be a replacement for your main station rig. It doesn't have RIT (I didn't need it during my testing). There is no jack for headphones and not an easy way to put in additional filtering. The rig does do a great job at what it was designed to do. The radio lists for $219.95 without the microphone and $229.95 with the mike. The AC portable power supply lists for $39.95. If you have not had your hands on one, you might want to try one of these on the air.

>
> How do I learn code Farnsworth?
>
The Farnsworth method just means sending/receiving/learning the individual characters at a higher speed, then stretching out the time between characters to get the total wpm down. The advantages are (1) the higher character speed deters you from trying to count dits and dahs (dah-and-four-dits...ummm...6) and helps you to learn the characters as unified sounds, and (2) as you increase your speed, the characters sound the same, just the time between them decreases. I think all the major CW tapes use Farnsworth, and all the major CW software programs allow you to specify it. Don't know about the ARRL code practice transmissions -- haven't listened in a while.

Good luck. It'll come easily enough if you don't fight it. Whatever you do, *don't* count dits and dahs, learn the characters as a combined sound.

kim -

well, the quick answer is that you may operate on all amateur frequencies
above 10 meters with a tech no-code. i urge you to pass the code test -
this will permit voice on a portion of 10 meters and open the door to the
lower frequencies using cw. the no-code tech freqs are just not that
exciting to use. i *have* been active on 2m ssb (available to a tech
no-code) and i find that interesting and challenging.

MID-ATLANTIC HAMFEST LISTING August 11, 1994

The following is a listing of known hamfests in the Mid-Atlantic area.
I will update this list as necessary. Please send any additions or
corrections to me at cps@access.digex.net so that others may benefit.

If you know of any hamfests not in this list, please let me know about
them so that they may be included in the next edition.

Hamfests that I know of, but need details: York, PA (Sept).

Thanks,

Chris Smolinski, N3JLY

If your "need" is truly a legitimate need, as opposed to simply a
personal desire for the capability to transmit outside of the ham bands,
you can send a fax on agency letterhead to 310/631-3912 (Kenwood Service
Dept), Attn: Clifford.

Ah, eh. I guess it may not just be exciting for YOU. People should
be encouraged to learn the code, only because its still used, and
a lot of people find it fun, and it does afford more privileges on
the lower bands. But to say that 50+ MHz isn't exciting
is a bit strong. This type of mentality is what helps fuel the code
wars -- I myself find all frequencies "exciting", for each has
its own characteristics.

2429. VE8KM 6M beacon

Newsgroup: rec.radio.amateur.misc
Date: 1994-08-11 22:49:21 UTC
From: dbcntcas@teleport.com
Message-ID: <dbcntcas-1108941449210001@ip-cb.teleport.com>
Source record: 261916

As many 6M ops know, the evening of 13 July was a good openning for US and VE 6m stations. Here in CN85 I noticed a signal around 50.004 beaming 30 degrees at 0515Z (14 July) which I thought was a European TV signal. It was a steady carrier, with some warble, running about S-5. About 0600Z finally caught the id, VE8KM (DP79.) This beacon id's once every 5 minutes with " de VE8KM." This beacon was up to S-7 and did not start to go into the noise until past 0700Z. Myself and KE7CX gave a few calls towards Europe on 50.110 after 0500Z. I would be interested to hear if any European 6M ops have heard this beacon this summer. TNX.

From: gilbaronw0mn@delphi.com
Message-ID: <9408111908594.DLITE.gilbaronw0mn@delphi.com>
Source record: 261855

I have a big problem with the smoke detectors in my home. They squeal when I transmit on 40 meters. They are the type that are permanently wired to the ac line. Has anyone had this problem and knows what to do about it. I can try bypasses or chokes or some such thing on the line I guess? I may have to go to a battery operated detector perhaps? Any thoughts on this from anyone? Respond here and if you have really important information please email me too at gilbaronw0mn@delphi.com. Thanks in advance.

SB DX ARL ARLD050
ARLD050 DX news

The items in this week's bulletin are courtesy of Steve, W9NUF, the Western Illinois DX Association, Bob, W5KNE, the QRZ DX newsletter, Tedd, KB8NW, the Ohio/Penn DX Bulletin, and the Contest Corral column from QST. Thanks.

CENTRAL KIRIBATI. T31BA and T31BB have been on the air a lot lately. Listen for them on 3795 kHz between 1030 and 1200z. Also try 40 meter SSB from 0600 to 1300z and 20 meter SSB between 2200 and 0400z. QSL T31BA via DL2ZAD. QSL T31BB via DF6FK.

SAINT KITTS. V44KAO has been quite active in recent days. He was worked on 7006 kHz at 0100z on Wednesday.

SAINT PAUL ISLAND. The CY9DX dxpedition has been cancelled.

SINGAPORE. The special prefix S61 will be used by amateurs through September 12. This is in conjunction with the 25th anniversary of the founding of the Singapore Amateur Radio Transmitting Society.

HONG KONG. Tom, VR2GC, is on the air most weekends. Check around 14015 kHz between 1230 and 1530z. QSL via G5JJ.

VIETNAM. JA1IED had been reported to be planning 3W6 activity from August 13 to 17. If not issued a 3W6 call sign, he will sign 3W6/JA1IED. Try 21150 to 21200 kHz for his SSB and 21010 and 14013 kHz for CW.

MALAWI. Eliseo, IN3VZE, is active as 7Q7CE until August 25. QSL via IN3VZE. John, 7Q7JL, has been worked on 18155 kHz between 1300 and 1530z. QSL via G0IAS.

NEPAL. Kyoko, NH6RT, has been heard signing 9N1KY. She was heard on 14184 kHz at 1648z and 14270 kHz at 1700z. QSL via Kyoko Yamakami, Box 3, Tokaimura, 319-11, Japan.

CHAD. Larry, F5IXR, is planning to be on the air beginning August 18 signing TT8/F5IXR until he receives his TT8 call sign. TT8XR has been requested. QSL via F5MXH. No documentation has been received for this operation.

EASTERN MALAYSIA. Dave, 9M8BT, continues to be active on 20 meter SSB with a very good signal into the East Coast. He was also heard on 20 meter RTTY. Best shots are between 1245 and 1500z. QSL via N5FTR. Johnny, 9M8DB, also has a good signal and operates around the same time as Dave. QSL via Johnny Tan, Box 1549, 98008, Miri, Sarawak, East Malaysia.

CHAGOS. VQ9TP has been doing a lot of CW on several bands. Most activity is between 1230 and 1630z. He was heard over the weekend on 18083 kHz between 1345 and 1600z. Also check the low end of the other bands. QSL via N5TP. Tom, VQ9TT, was heard on 14014 kHz at 1300z.

MONACO. Mike, W5ZPA, plans to sign 3A/W5ZPA from August 16 to 20. Listen for his CW, SSB and RTTY in the usual DX windows. QSL via W5ZPA.

AMSTERDAM ISLAND. FT5XJ has been signing FT5ZF, working mostly ZLs, Europeans, JAs and western USA. QSL via F5NLL.

TOKELAU ISLANDS. 5W1UC is signing ZK3UC. QSL via Box 615, Apia, Western Samoa.

GREENLAND. Karl, OX/DL1VU, should be on until August 25. He prefers operating CW. QSL via DL1VU.

THIS WEEKEND ON THE RADIO. The CW weekend of the European DX Contest is from 0000z August 13 to 2400z August 14 on 80, 40, 20, 15 and 10 meters. Exchange signal report and serial number. Stateside stations also give state. Details appear on page 126 of July QST.

The ATV Quest Contest, sponsored by ATV Quarterly, is from August 12 to 14. FSTV Sprints are any 36 hour period and SSTV are any 24 hour period. Exchange call signs via video modes. For more information see page 120 in March QST.

SUBJ: IPS DAILY SOLAR AND GEOPHYSICAL REPORT
ISSUED AT 11/2330Z AUGUST 1994 BY IPS RADIO AND SPACE SERVICES
FROM THE REGIONAL WARNING CENTRE (RWC), SYDNEY.
SUMMARY FOR 11 AUGUST AND FORECAST FOR 12 AUGUST - 14 AUGUST

1A. SOLAR SUMMARY
Activity: very low

Flares: none.

Observed 10.7 cm flux/Equivalent Sunspot Number : 77/16

GOES satellite data for 10 Aug
Daily Proton Fluence >1 MeV: 6.4E+05
Daily Proton Fluence >10 MeV: 1.3E+04
Daily Electron Fluence >2 MeV: 2.2E+06
X-ray background: A3.7
Fluence (flux accumulation over 24hrs)/ cm2-ster-day.

1B. SOLAR FORECAST
12 Aug 13 Aug 14 Aug
Activity Very low Very low Very low
Fadeouts None expected None expected None expected

Forecast 10.7 cm flux/Equivalent Sunspot Number for 12 Aug: 77/16

2A. MAGNETIC SUMMARY
Geomagnetic field at Learmonth: unsettled

Estimated Indices : A K Observed A Index 10 Aug
Learmonth 13 2333 3233
Fredericksburg 15 15
Planetary 15 16

Observed Kp for 10 Aug: 3232 4443
2B. MAGNETIC FORECAST
DATE Ap CONDITIONS
12 Aug 13 Unsettled
13 Aug 10 Unsettled
14 Aug 8 Quiet to unsettled
COMMENT: IPS Geomagnetic Warning 2 was issued on 7 August and is
current for interval 10-12 August.

3A. GLOBAL HF PROPAGATION SUMMARY
LATITUDE BAND

DATE LOW MIDDLE HIGH
11 Aug normal normal fair-normal
PCA Event : None.

3B. GLOBAL HF PROPAGATION FORECAST
LATITUDE BAND
DATE LOW MIDDLE HIGH
12 Aug normal normal fair
13 Aug normal normal fair
14 Aug normal normal fair

4A. AUSTRALIAN REGION IONOSPHERIC SUMMARY
Observed
DATE T-index MUFs at Sydney
11 Aug 34 about 10% above predicted monthly values, with spread
F 8-15UT and enhancements of 30-50% from 11-18UT(local night).

Predicted Monthly T-index for August: 20

4B. AUSTRALIAN REGION IONOSPHERIC FORECAST
DATE T-index MUFs
12 Aug 30 About 10% above predicted monthly values
13 Aug 25 Near predicted monthly values
14 Aug 25 Near predicted monthly values

Nope. Well sort of. All I did was show my Lic and that about cleared things.
Or showed them the countries Lic. For Example in the Azores Islands(Portugal,
VE3TOS/CU3) and that cleared things with me. But I've never had much problems.

K3JL is on 147.075 MC.

You will likely be able to hit the O.City repeater with
a mobile radio on 147.015, using 5A PL. You can also decode 5A
on your end if you tire of hearing weak distant repeaters.

Mark has a UHF repeater in O.City on 443.45 MC, also
using 5A PL.

Now, N3OLY has a brand spanking new repeater coordinated
on 147.33 MC. I don't know if it is on the air yet.

Last year I went there well armed. I took a dual band ht and an 25w all mode.
For antennas, I took a drubber duckie, and mfj dual band colapsable and
an mfj 3 element beam.

I could hear repeaters in wilmington, and dover de. I could also hear
one on the coast of virginia. I could hit the va one with the rubber duck
and with the beam (and 25 watts) I could hit the one in wilmington. At one
point I was in a qso on the wilmington repeater with om's in pottstown
pa, vineland nj, and baltimore md.

440 and 2m ssb was dead. One night I was heard a cw cq...cq....cq...
on 144.200, but he would not return my call on usb.........

There was a rental house, but not the one we rented that came with a
cushcraft R7.

How about a personal desire to transmit on the *entire* 420-450 MHz amateur band? The 733 won't transmit all the way down, and there are legitimate reasons to transmit there on FM, like testing of auxiliary links operating between 420 and 430.

: sought as a high-up kick to get around the hills and out of the
: dales*. If this were the case...

: 2m HT---> 2m x 440 mobile---> 440 HT
: and
: 440 HT---> 440 x 2 mobile---> 2m HT

: wouldn't the two-rigs constitute a SINGLE repeater? As long as
: each op ID'ed "The Repeater", you have an id on each freq, thus are legal.

A group of ham friends of mine, used to get together at a
restaurant late wednesday nights, and check into a net on
a (fairly) distant 2m repeater (about 50 miles).
Inside the restaurant, with HTs and big 5/8s, we could barely
hear the 350 watts of the repeater, let alone get into it...
Now, we discovered that a 5 watt HT with a big mobile antenna
in the parking lot, could get into the repeater...
So, we set up the HT into crossband... And we could get into
the repeater... Then we decided, now, if only we could hear
it better... so, we setup a second HT crossbanding the
repeater back to us (low power... even then, that little
Icom W2A would get toasty hot)...
Kinda nice, one of the guys had a 440 repeater pair for the area
that wasn't at use... so we just used that.
Eventually, we got some mobiles... and that made it alot
easier... for ID'ing, we playing around with using a KPC3
with it's CW id... although, we also built some strange looking
circuits to do it also...

Enough of my rambling... :)

Ed,

Because the front is the chassis. A refitter takes the standard chassis an
builds the ambulance around it. Look even closer and you'll see a plate
on it that says Braun, Med-Coach, Horton, or a dozen others. The Dodge
RamCharger, the Jeep Cherokee, GMC's Blazer and Surburban, and the Ford Ranger
are all used as Emergency Vehicles, and none of them have any special shielding
I just asked a friend who repairs the NYS Police cars and he told me if there
is any special shielding on them cars he hasn't seen it and no reference is
made to it in the Ford and GM repair manuals. I guess NYS and none of the
emergency services around me bought the shielding :)

The best answer is still: If you want me to buy your 20,000 dollars car, it
damn well better work with my $300+ radio or I go elsewhere.

Also exclusions to warantees such as ham radios, and cell phones can not be
made legally in some states anyway. You know the fine print "some states may
not allow some exclusions"

Yes Dave

A Technician - No code licensee who passes el 1a (5wpm) will get a
new license from the FCC. In the interum before the license arrives
she can operate in the Novice bands when in position of a certificate
of completion, signed by the 3 VE who gave the 5wpm exam. Once the license
arrives there is no legal reason to keep the certificate. You may want
to display it, at least if it is one from a W5YI group... I think
their 8x10 3 color C of Cs are quite nice. Actually more impressive
looking than the real FCC license certificate.

Good luck with the General :-)

Kevin

I am not sure what KA9MWT and KB9QL are doing. Were they your examiners?
Since day one of the tech plus a 610 has had to be filed with the VEC
(volenteer exam Cordinator) who in then folwarded them to the Alabama VEC
which kept a central list that was folwarded to the FCC peridically.
Recently the FCC has "improved" their computer system and is now doing
all the tracking of Tech Plus licensees themselves.

I am not sure your upgrade is / was legal. It has always been necessary to
have three examiners (VEs) operating under the authority of a VEC to give a
Tech (no code) licensee the 5 wpm exam to upgrade to Tech +.
It was an interesting quirk that 2 "independent" Generals could give
an unlicensed person the novice 5wpm exam, but it took 3 examiners
in a VEC coordinated exam to give a Tech licensee the same 5wpm exam.
All that was resolve when the Novice test was rolled into the VE program,
now the novice test also can be given only at a VEC cordinated session
supervised by 3 VEs.

not knowing much about the format of the new T-2 exams, i can't say for sure, but i find it impossible to believe that the new ones would bear any resemblence (living or dead) to the old T-2 exam.
Solid state practically didn't exist when that exam was written! (my exam was dated May 1952, and I took it in 1992). Seriously, my exam covered vacuum technology circuits that were popular in the '30s and '40s. It was a lot of fun to sort through all that stuff, but i have to (grudgingly) admit that the call to modernize these exams had much merit.
HOWEVER, if you're still interested in "how it used to be", I have several study guides for the old radiotelegraph (and radiotelephone) exams that are fun reading (both technically and historically). Contact me directly if you decide you want one. Otherwise, good luck on the exam!

> that by outputting more RF or AF power).

This is interesting. When I got my Yaesu FT-530, I made some crude measurements of the power consumption and found that it never draws more than 1.1 amps on 2m (slightly less on 440) . If you apply 6 volts, it draws the least. Then it draws gradually more current as you turn up the supply voltage, until it gets to about 10.5 volts. It draws 1.1A at 10.5V, and stays that way up to 16V (the max rated voltage). I didn't go higher, since it's my pride and joy. :-)

The receive portion is even more constant. When sitting idle on both bands with no power saving enabled, it draws around 100 mA. It does this at *any* voltage level (6-16). It seems to be a constant-current load for idle standby. Of course, incoming audio, loud volume settings, LED backlighting, and other stuff turns up the current draw.

I realize your resistor model was only an approximation, but I was surprised to see that it controls its current so consistently over the voltage range. I could have measured it wrong, but that's what it looked like.

Happy Hacking!

>
>Good luck with the General :-)

In re reading my own post I just realized I didn't make it clear I am
talking about someone who upgrades to tech plus now. For the last
few years untill the FCC upgraded their computers NO Tech Plus licenses
were issued. The VECs kept a listing of the Tech pluses issued which
was shared with the FCC. The official line was that the Certificate of
Completion was to be saved forever, or untill a general was earned.

Now that the FCC is issuing Tech Plus licenses it is not clear what
they will do with all those Techs that should have licenses that say
Tech Plus but don't. Several people have written asking if they should
send in a 610 to get their license "modified". My own feeling is not to make
the paperwork crunch at the FCC worse and just to wait till renewal is
necessary, least we make the delay for new commers worse. Keep your C of C.

It is not clear the FCC knows how to or has even thought about handling
all the older tech license that shoud be listed as Tech plus.
I was just talking to someone from CA who was has tech first issued
24 years ago, he cretainly has code credit along with el 3b credit,
but the renewal came through last month, as a plain tech.
Hopefully the FCC realizes this is a problem and can do something about it.
Mabey they have to buy yet another computer or at least a couple of years
of programing :-) I wonder how many hours ($) some consultant will spend
fixing this bug (feature)?

NOTE: The Effective Sunspot Number for 10 AUG 94 was 26.7.
The Full Kp Indices for 10 AUG 94 are: 3- 2- 3+ 2- 4- 4o 4o 3-
The 3-Hr Ap Indices for 10 AUG 94 are: 11 7 18 7 25 27 29 11
Greater than 2 MeV Electron Fluence for 11 AUG is: 4.6E+06

SYNOPSIS OF ACTIVITY

Solar activity continued very low. Region 7762 (N04W51)
showed trailer decay. A small H-class spot rotated around the
east limb and was numbered as new Region 7764 (S05E68).

Solar activity forecast: solar activity should continue
at the very low level. There is a slight probability of a
C-class flare from either Region 7762 or 7764.

The geomagnetic field was mostly unsettled to active. Some
high latitude sites experienced brief periods of minor storming

in the 1200-1500Z reporting period. Energetic electron fluxes
began to increase near 1300Z and reached moderate levels at the
end of the period.

Geophysical activity forecast: the geomagnetic field
should be unsettled to active on 12 Aug. Mostly unsettled
conditions are forecast for 13-14 Aug but isolated active
intervals are likely during that time. Energetic electron
fluxes at geosynchronous orbit could reach high levels on
12 Aug.

Event probabilities 12 aug-14 aug

Class M 01/01/01
Class X 01/01/01
Proton 01/01/01
PCAF Green

Geomagnetic activity probabilities 12 aug-14 aug

A. Middle Latitudes
Active 40/35/30
Minor Storm 20/15/10
Major-Severe Storm 10/05/01

B. High Latitudes
Active 45/40/35
Minor Storm 20/20/15
Major-Severe Storm 10/10/05

HF propagation conditions were unsettled during the first
half of the UTC day. Transauroral night-sector circuits
experienced periods of minor signal degradation, but most other
regions were near-normal. By the end of the UTC day, most
regions, including night-sector transauroral circuits were
near-normal. Slight signal degradation can still be
periodically expected over the night-sector high-latitude
regions over the next 24 to 48 hours. Most other regions
should continue to see near-normal propagation.

NOTES:
All times are in Universal Time (UT). Characters preceding begin, max,
and end times are defined as: B = Before, U = Uncertain, A = After.
All times associated with x-ray flares (ex. flares which produce
associated x-ray bursts) refer to the begin, max, and end times of the
x-rays. Flares which are not associated with x-ray signatures use the
optical observations to determine the begin, max, and end times.

Acronyms used to identify sweeps and optical phenomena include:

II = Type II Sweep Frequency Event
III = Type III Sweep
IV = Type IV Sweep
V = Type V Sweep
Continuum = Continuum Radio Event
Loop = Loop Prominence System,
Spray = Limb Spray,
Surge = Bright Limb Surge,
EPL = Eruptive Prominence on the Limb.

2452. Info on AB Magnetics NF meter?

Newsgroup: rec.radio.amateur.misc
Date: 1994-08-12 08:48:30 UTC
From: lehane@sni.co.uk
Message-ID: <2E4BA6F0@squidgy.sni.co.uk>
Source record: 261798

Hi,
I recently picked up an AB Noise Figure Meter 117A, made in Sweden, from a surplus store at a good price. Unfortunately it only has the plug in for noise tubes.

Missing is the 1177 plug in for the internal noise diode and the 1176 modulator unit for 28V units, which is the plug in I'm most interested in. Given the size of the PCB there can't be too much on it.

Does anyone have any info., schematics or a service manual for the unit, which I understand was quite widely used about ten years ago?

Thanks in advance,

Lehane

2453. Special Event Station Announcement

Newsgroup: rec.radio.amateur.misc
Date: 1994-08-12 09:55:14 UTC
From: hrc@imcldn.demon.co.uk
Message-ID: <776685314snz@imcldn.demon.co.uk>
Source record: 261749
Cross-posted to: rec.ham-radio,rec.radio.amateur.misc,rpi.union.ham-radio,uk.radio.amateur

Greetings to all OM, and YL.

The Hoddesdon Radio Club will be running a special event station in aid of Wood Green Animal Shelters from 2300Z (0000 Local) Friday, August 26 through to 1700Z (1800 Local) on Monday, August 29.

We expect to be operating on HF (80m - 10m), 6m, and 2m.
If you want to arrange a sked with us, please send mail as follows :-

Packet
G7OBS @ GB7DAA.#33.GBR.EU
Internet
hrc @ imcldn.demon.co.uk

We expect to have a small contingent from USAF Alconbury on hand, so I am sure any Stateside QSO's would be welcomed. Callsigns to look out for are GB2WAS on HF, and GB1WAS on 6m & up. Special QSL cards are available for working these stations.

Hope to meet you on the band

73's Mike G7OBS
Contest Manager

Do you think anybody besides us _ever_ pays for the government? They tax
us directly and they look bad, so they don't get re-elected. So they tax
us indirectly, they look great, the total cost to us is greater, and...same
s--t, different day.

I am sure that your best bet would be to use a thermistor as the
temperature sensor. It will give you a large, accurately known,
resistance change with temperature. The resistance, then, could be
used in an R-C oscillator with predictable and repeatable
frequency-temperature characteristics.

I will leave it to others to advise how you may be able to couple
sufficient power into the circuit from one meter away! :-)

Not sure I understand that. Object of Farnsworth is to learn the sound of the characters at a useful speed. When you're proficient with the sounds, it's easy to shrink the space between them until you've got standard spacing. It's just a tool in the learning process. If you know the character sounds, you can copy the characters on the air, from the computer, or from the exam tape.

>or not...

Yes. You're going to die from radiation.....or not. Nobody
gets out of here alive. What you really want to know is whether
the risks from RF exposure are sufficient that they will dominate
the other ordinary risks you run every day. One way to examine that
is to look to see if hams die on average earlier than the general
population. A visit to a hamfest, or listening on 75 meters will
probably convince you that old hams are not scarce. In fact, as
of 1989, the average age of US amateurs was 57 while the average
age of the population was under 30. Since amateurs generally aren't
licensed until their teens, we have to adjust for that. Still, that
makes the average amateur 15-20 years older than the average of
the general population. That seems to indicate that the risks of
being an amateur don't lead to an early death.

>which uses two roller inductors and three very large capacitors;
>this and some of the prefab ladder line is nine feet away from
>my body. I mainly do SSB on 40/20/17 meters.

If you've followed proper shielding and grounding techniques, there
shouldn't be excessive RF radiating from your *equipment*. If the
tuner, line, and load aren't well balanced, there may be some radiation
from that source. For the bands you work, RF field strengths of less
than a couple hundred volts/meter are generally considered acceptable.
You should be well inside that range unless you're getting RF "bites"
from your equipment. The primary danger seems to be RF heating of
tissue. The eye is most sensitive to this, and persons working around
strong EM fields have a higher incidence of cataracts than those who
don't.

There's another question, however, and that's the bio-hazard of low level non-ionizing radiation. Primarily these are magnetic or electric *induction* fields rather than radiation fields. Most of the concern seems focused at very low frequencies, such as 60 Hz. It's possible that you are being exposed to magnetic fields from the power transformers in your equipment. The studies done on this topic are still producing conflicting results. There may be some long term mutation hazard from these fields, or there may not. Certainly, other equipment in your home and at your workplace (like a computer monitor) are exposing you to fields that are probably in excess of anything you're getting from your amateur equipment.

>Did I miss anything?

You need heavier power wiring. Number 8 should be considered minimum
for a radio in this power class.

The radio needs a low *inductance* ground to the chassis. A single bolt
connection won't be as good as a wide strap bonded to the underbody.
You should, of course, bond other body panels, hood and doors too,
with strap. The way they paint panels separately before assembly
means you likely won't have good ground contact from body part to
body part unless you bond them yourself.

The through the glass antenna, and your mounting scheme, are abominations.
Not only will the coax radiate RF in the cabin, but also the whip will fire
considerable RF directly back into the cabin, and near to your vulnerable

head and eyes as well. You need to rethink this part of your installation.

If clearance height is the major concern, Comet makes short dual band antennas to aid you with this. Performance isn't quite as good on 2 meters as a longer antenna, but 440 performance is fine. The one I use on my vehicles is only 11.5 inches tall when mounted in the center of the top via a NMO mount. That clears most any parking garage. I keep a Larsen dual bander to screw on instead when on trips where extended 2 meter range may be needed.

If the problem is that you simply can't bring yourself to drill a hole (it won't hurt resale), then a trunk mount fastened to the top of the hatch will at least give some decoupling of the coax shield and reduce the amount of RF in the cabin. And it'll move the antenna further from your head in case there is still some RF being fired directly back into the cabin.

Forget the glass mount next to your head. It's a horrible idea.

Source record: 261764

In article <1994Aug11.021553.20976@news.media.mit.edu> steve@media.mit.edu (Steve Mann) writes:
>I was wondering if anyone has had experience with both single band
>radios and dual band radios. How do you find the performance compares,
>say between a dual band radio set to 2m and a single band 2m radio.
>Is something sacrificed in the design, making the radio operate on
>two different bands (e.g. are the tradeoffs drastic enough that the
>performance of both bands is impaired)?

Whether the radio is dual or single band isn't nearly as important as whether it is wide coverage rather than ham band only. The key to good radio performance is a tight front end. If the radio covers a wide frequency range, it can't have a tight front end and intermod and fundamental overload will wreak havoc with your reception. Unfortunately, most 2 meter radios, whether part of a dual bander or not, have wide front ends today. Radios that can do dual in-band receive are the worst since both sides of the radio have to be very wide in order for them to serve both bands.

>Looking in the HRO catalog, I see most of the dual band radios also
>feature full duplex ``telephone-like'' capability.

Most modern dual banders can receive on one band while transmitting on the other. Some offer dual in-band operation where both sections of the radio can work on the same band. That opens the possibility for in-band reception while transmitting, though usually the other section will be severely desensed unless the lowest power setting is used.

>Some of the single band transceivers receive on another band (e.g. the
>ICOM IC-21A is a transceiver on 2m and a receiver on 440MHz), and also
>claim ``full duplex cross band operation''. Would the reception be
>reasonable on 440MHz? Or would the reception be poor, given that the
>IC-21A is really optimized for 2m?

This is somewhat misleading. Crossbanding is normally only useful in conjunction with a system including a crossband repeater. These cannot be controlled on 2 meters, and so the radio really needs to be able to transmit on 440 while receiving on 2 meters. Thus the Icom's feature is of little value.

>Just wondering if anyone's tried full duplex, and if so, is it better
>to do it with 2 separate radios (e.g. a 2m transciever and a separate
>440MHz transceiver), or would you get better performance doing it with
>a dual band radio, such as an FT530 or DJ580.

Ah, the light finally dawns, you're talking about handi-scratchies, not real radios. *None* of these offer good performance, just pick the one that has the most Gameboy features so you'll at least get *some* use out of it. :-(

If you must depend on a HT, at least get something solid like a Motorola HT-220 or GE Mastr PE.

>
> I'm interested in this as well, where could I get such a repeater ? Cost ?

Well like with fixed repeaters, you normally build them. Motorola will
sell you one ready to go, but if you have to ask about cost, you can't
afford it. Basically this is no different than any other repeater. The
only consideration is that it has to run off 13.8 volts and that the
duplexers fit in the car. Those aren't problems, especially if you keep
the power reasonably low.

Mine fits in a Haliburton aluminum camera case and uses Neulink TX
and RX strips with a Sinclair mobile duplexer. Control is via a CTCSS
accessed S-Comm 5K. It has it's own 12 volt gelcell for portable use,
and can be jacked into car power for mobile use. I've got about $450
in it thanks to some careful scrounging.

Yeah, but Algore, along with his reinventing government task force, is
certainly quick to take credit for it. Much in the same way that Comrade
Clinton is trying to grab credit for an improved economy even though his
stimulus package never passed.

Yep. The public will wind up paying for this windfall to the government
through extra fees to the businesses who won the bids. No business pays
fees or taxes, they just act as collectors, taking the money from their
customers via increased prices. Why do you think a new car costs as much
as your house did twenty years ago? The metal and the hourly wage haven't
gone up that much. Most of the increase is due to pass through of costs
imposed by government regulation and government business taxes. Now
Comrade Clinton wants to do the same with medical costs via employer
mandates.

Gary

Joseph
I would suggest looking into a rather modern, used ALL-MODE 2 meter rig. The
reason is you may eventually become bored with FM. There is a lot of less than technical talk on the repeaters. Packet with keep you busy if you have access to some good servers in your area. I find SSB and CW an interesting challenge on 2m. It does require a horizontally polarized antenna though. (down 30 dB if cross polarize) SSB and CW would be something to grow into. Good results take a good station. But it is very possible work out 600 miles on lite tropo enhancements and out about 1400 miles using meteor bursts, sporadic-E, FAI, etc.
Anyway, something you may want to check into incase you buy only ONE rig. I found HTs just didn't have the power I needed to work stations without a repeater and the repeaters were always busy when I wanted to operate. The ARRL has an informative book titled something like "VHF: beyond the horizon".

2465. Re: Commercial Radio Telegraph License

Newsgroup: rec.radio.amateur.misc
Date: 1994-08-12 13:49:54 UTC
From: twp77@isuvax.iastate.edu
Message-ID: <32fum2$lf3@news.iastate.edu>
Source record: 261795

This thread got me wondering. (I know this isn't amateur radio, but
I'm curious.)

What is required for the Commercial Telegraph licenses? What is the
difference between second and first class? (Is there a third class?)
If I wanted to try this, what would I--as an Amateur Extra--have to do?

Thanks in advance for any information that may quench my curiousity.

In article <32e9pj$4kq@agate.berkeley.edu>, kennish@kabuki.EECS.Berkeley.EDU (Ken A. Nishimura) writes:
>But to say that 50+ MHz isn't exciting
>is a bit strong. This type of mentality is what helps fuel the code
>wars -- I myself find all frequencies "exciting", for each has
>its own characteristics.

Why does it fuel the code wars? The different characteristics of different frequencies just appeal differently to different people. (If you can follow what I just said. I don't think I could have said "differently" another time if I tried. :-) Personally, my favourite mode is HF CW. I also enjoy the service stuff I'm involved in up on VHF and UHF. Now, I don't find the stuff above 440MHz very exciting--at least not now--but many people do.

Leave him alone. This "you're different so I'll jump on your back" mentality seems to have much more to do with fueling the code wars than what frequencies we find exciting.

This is the - British Amateur Radio Teledata Group - News Broadcast Service
for all Amateurs and Short Wave Listeners interested in RTTY Amtor, Pactor
and Packet Radio.

This news is broadcast during the first full week commencing Monday each
month, to the following schedule..

Evening transmissions at 1930 GMT. on 3.584 MHz. Mark. +/- for QRM.
RTTY on Monday-AFSK, Wednesday-AFSK and Friday-FSK
Pactor-FEC on Tuesday.
Amtor-FEC on Thursday and Saturday.

Morning transmission at 1000 GMT. on 7.041 MHz. Mark. +/- for QRM.
RTTY on Sunday-AFSK.

An edited version of this bulletin is available on the Packet network as a
BARTG at GBR. file thanks to: Andy (G3ZYP) at GB7MXM.#36.GBR.EU.

It is also posted on the "INTERNET" system via the INFO-HAMS list on UCSD.EDU.
thanks to Iain (G6ARO) who is available on the "JANET" network as
Iain@HUMBER.AC.UK

News for August 1994. Bulletin No. 020.

BARTG Information.
The BARTG Rally takes place on Sunday 11th September in the Sandown Exhibition
Centre, Esher, Surrey. Doors open at 10:30, the venue will be well sign posted
with talk-in on S22. Plenty of free car parking and trains from Waterloo stop
at Esher station. The rally will inclide top companies and special interest
groups plus a Bring and Buy. On site catering with hot and cold meals, snacks
and licensed bar. All DATA modes catered for plus much to interest the computer
buff.
Mark the date. Mark and Space the DATA.

Early notice of the BARTG AGM. This year the Annual General
Meeting returns to London on 5th November at
London House, Mecklenburgh Square.
Full details will be published in the Autumn issue of Datacom.

RTTY DX Activity. (All times are GMT.)
14 MHz.
1A0KM, YW0RCV and ZA1MH 0730. 4Z5GN 0830. T97V 0930. Z21HD 1130,
YB3AQF and EA8ATE 1330. YW0RCV, OD5PL, BY1QH and TF5SJ 1430.
5Z4FM and SV5AZP 1500. EA6NB, 3B8CF, VR2GO and 4S7/JA4FM 1530.
9V1ZS 1630. FR5ZU/T and DU1BJD 1700. A22EX 1730.

CE3GN, 7Q7ZZ and 9K2WA 1800. A41KD 1830. 9A3TB 1930. TA2II 2030.
EA9KQ 2200.

QSL Information.
1A0KM via IK0FVC. OD5PL via HB9CRV. 4S7/JA4FM via JA1FHK.
TF5SJ via LA0BX. A22EX via N4CID. FR5ZU/T via VE2NW.
9V1ZS P.O.Box 24, Raffles City, Singapore 9117.
YW0RCV (Aves Island.) via Radio Club Venezolano. POB 2285,
Caracas 1010-A, DF, Venezuela. (Note: 1 IRC does not cover return
airmail to Europe).

Contests.
The CQ World Wide RTTY contest starts 0000 GMT September 24th until 2400 GMT September 25th on all 5 HF bands.
All digital modes may be used, Baudot, ASCII, Amtor and Pactor (FEC and ARQ), Packet (no unattended operation or contacts through gateways or digipeaters).
A station may only be worked once per band to score, regardless of the digital mode employed. The same station may be worked on other bands for additional points.

Classification.
1. Single operator all band and single band.
2. Single operator assisted, all band only.
3. Multi-operator, single transmitter, all band only.
4. Multi-operator, multi-transmitter, all band only.

Categories.
Single operator entries may enter either (A) All band or (B) Single band.
Single operator assisted and Multi-operator entries can only enter the all band section.

Contest period.
The total contest period is 48 hrs. but no more than 30 hrs. Of operation are permitted for single operator stations. The 18 hrs. Of rest can be taken at any time during the contest period in blocks of not less than 3 hrs. duration which must be clearly marked in the log and summary sheets.
Multi-Operator and Multi-Multi stations may operate the entire 48 hrs. contest period.
Single operators may operate more than 30 hrs. but only the first 30 hrs. will count towards the official score. (This allows rarer DX to give their multiplier to more stations).

Exchange message.
Within the 48 continental United States give - RST - State or VE area - CQ zone number.
All other stations exchange - RST - CQ zone number.

QSO points.
One (1) QSO point for contacts within your own country.
Two (2) QSO points for contacts outside your own country but within your own continent.
Three (3) QSO points for contacts outside your own continent.

Multipliers.
One (1) Multiplier for each US state (48) and each Canadian area (13) on each band.
One (1) Multiplier for each DX country on each band. KH6 and KL7 count as DX countries but not as states.
USA and Canada count as countries for the first contact on each band.
One (1) Multiplier for each CQ zone (40) on each band.

Final score.
Total QSO points times total multipliers.

Logs must be post marked no later than November 28th to qualify.
Originally-To:- Roy Gould KT1N, CQ-WW RTTY DX Contest Director, P.O.Box DX, Stow, MA-01775, USA.

Notes of interest.
Cards for TT8OBO (Chad) are not being accepted for credit by the DXCC desk until they receive further documentation to validate authority to operate.
The planned activity from St. Paul Isl. (CY9) by Randy N0TG and others has been postponed until September 19-25 in order to take advantage of improved conditions.
Increased postal charges in Japan now require 120 yen for a 10 grm airmail letter to Europe. One US dollar exchanges for 100 yen while one IRC exchanges for 130 yen meaning one IRC or two dollars for return QSL's.

Thanks this month to..
G3ZYP. OPDX (BARF80). DXNS.

BARTG caters for all DATA interests with information-components-kits -ready built units and software from experts. Members receive a 120 page quarterly journal devoted to data modes. Beginners guides for most data modes are available. The group sponsors HF and VHF RTTY contests, administers its own DX and members award scheme and runs an annual rally.

This copy of BARTG News is posted by Iain Kendall (G6ARO) who can be contacted via Internet e-mail at.. iain@humber.ac.uk Items for inclusion in the broadcast may also be mailed to this address, as well as any queries regarding membership or services offered by BARTG.

Copy of the news as distributed by G0ARF 940726.

There has been *much* more proof of the hazards of smoking than the hazards of RF. Sure, if someone stands right next to an antenna running mega-power, they *might* have problems.

What people think they can do get rid of this danger (if it really exists, and the studies ar inconclusive) is ridiculous! Not listening to the radio will not do a lot of good when the radio waves are still in the air. Turning on a radio to *listen* does not produce more EM waves.

>radios are the popular ones. I want something that is going to be reliable
>and have user friendly features. One more thing, I need recommendations on
>amateur radio and satellite magazines.

The code test free Technician license gives you access to all amateur frequencies above 30 MHz. As to what brands of rigs are popular, it's only fair to say *all of them*. There are people who favor each of the major manufacturers. There are very few total dog radios on the market today (most of those are made by Kenwood). Icom, Yaesu, Alinco, Standard, etc (even Radio Shack) all make good radios for some purposes. As much as it pains me to say it, even some of the Kenwood radios are OK for some uses.

As for magazines, well of course you want QST, which you'll get when you join the ARRL. The best magazine is Communications Quarterly, though QEX sometimes is worthwhile. For general interest hamming, you can't avoid 73 Magazine and the irascible Wayne Green. If, heaven forbid, you decide to work DX, then you'll want that CBer's dream magazine, CQ. Since you said you were interested in satellites, you'll want to join AMSAT and receive their informative magazine.

For equipment, I'd suggest looking at the used market first. Unless you *enjoy* taking that big depreciation hit as you walk out of the store, you'll get better value by buying used. A good HT with a friendly user interface is the Yaesu FT470. A good desktop satellite radio is the Yaesu FT736R. Icom makes good desktops too, with the IC275 and IC475 best for satellite work. (Icom has two combo radios pushed for satellites, but neither is as good as the twins.) Avoid the Kenwood 790A if satellite is your thing. This is a nasty radio. For general mobile FM use, I think the Alinco radios offer the best value, but all the major manufacturers offer serviceable radios for this purpose. It's hard to beat an old IC28H as a 2 meter mobile or packet rig, and the Icom IC2AT and IC4AT, while getting long in the tooth, are still about the most rugged, simple, and reliable HTs on the market.

>go to a battery operated detector perhaps? Any thoughts on this from anyone?
>Respond here and if you have really important information please email me
>too at gilbaronw0mn@delphi.com. Thanks in advance.

The standard treatment would be a couple of 2.5mH chokes in series
with the leads, and a .001 disc ceramic capacitor across the line.
However, if these are the type that talk to each other via carrier
current on the AC line so that all of them sound when one detects
smoke, you can't do this. You may be hosed. Your other alternative
is to try to get the 40 meter energy away from your wiring. Locate
your antenna higher and/or further away from the house.

2477. Re: Which code learning method? Why? -- a new twist

Newsgroup: rec.radio.amateur.misc
Date: 1994-08-12 14:31:11 UTC
From: vinod@watson.ibm.com
Message-ID: <32g13f$t2n@watnews1.watson.ibm.com>
Source record: 261808

Since we have spent so much time writing about which method
to learn for _copying_ code, how about some words of wisdom on
how to learn to send code? I passed the 5wpm test, and have been
doing some more listening, so I am probably upto about 7 or 8wpm,
except for still not being too good with the numbers and prosigns.

I don't want to go on the air without some sending practice, I plan
to build an oscillator _real_soon_now, but give me some general
pointers, biases, opinions..(learn to send fransworh, no learn to
send slower, learn to send only with a keyer, learn with a straight
key, learn by trying to send to SuperMorse..whatever your personal
favorite method of learning or teaching is).

Don't want to be a party pooper - but isn't the Smith chart
copyright?

I suspect it qualifies as artwork/literature and gets protected until
50 years after Mr Smith pops his clogs.

I could be wrong, but it may be wise to check before being seen
passing it around on a public forum.

>pls let me know. Happy studying!

You can get them from the ARRL by email using the info@arrl.org
address (put the word "help" on a line by itself in your message) or
by ftp from the usual places in a directory something like
pub/hamradio/arrl/infoserver

I would like to find out how to modify my Alinco DR-600T (2m/440 mobile) to be capable of low-speed (300 and 600 baud) FSK modulation. I am playing around with some used pagers that have been recrystaled for the 440 band, and I need to encode & decode FSK. I'll be using A/D and D/A converters to generate and decode the signal. I just need to be know how to get directly at the discriminator, and varactor, of the DR-600. Can anyone help me out?

SB NEWS @ AMSAT $SPC0815
* SpaceNews 15-Aug-94 *

BID: $SPC0815

=========
SpaceNews
=========

MONDAY AUGUST 15, 1994

SpaceNews originates at KD2BD in Wall Township, New Jersey, USA. It is published every week and is made available for unlimited distribution.

* STS-68 LAUNCH DATE SET *
==========
NASA managers have selected August 18 as the official launch date for Shuttle mission STS-68, the second Space Radar Laboratory flight. Liftoff is planned for 6:54 AM EDT at the opening of a two hour, 30 minute window. The mission is scheduled for 10 days, with a planned landing on August 28.

STS-68 will be the seventh flight of orbiter Endeavour, and the 64th mission of the Space Shuttle program. Commander Mike Baker heads a six person crew which will operate in two shifts for continuous scientific data gathering during the mission. Other crew members are pilot Terry Wilcutt, and mission specialists Steve Smith, Dan Bursch, Jeff Wisoff and Tom Jones who flew on the first successful SRL mission in April.

Endeavour's primary payload will be the Space Radar Laboratory, part of a comprehensive effort under NASA's Mission to Planet Earth program, to understand how the Earth's environment is changing.

[Info via NASA]

* MIR NEWS *
============
The Soyuz-TM20 spacecraft will be launched to the Mir space station on 03-Oct-94 carrying a European cosmonaut who will remain on Mir for 30 days. The visiting cosmonaut will conduct experiments relating to life sciences including the monitoring of the human body in microgravity conditions.

The launch of the Progress-M24 cargo vehicle to Mir that was originally supposed to be launched during the July/August 1994 time frame has been postponed because of economic reasons. Progress-M24 is now expected to be launched on 24-Aug-94 and will deliver the normal cargo to the Mir complex in addition to equipment to be used by the European cosmonaut (Ulf Merbold or Pedro Duque) during the EuroMir94 mission in October 1994.

[Info via Chris v.d. Berg, NL-9165/A-UK3202]

* DC-X TO BE REPAIRED *
==========
The DC-X launcher has been in limbo since it was damaged in a ground equipment induced explosion. According to Charles "Pete" Conrad, who is with the McDonnel-Douglas test program, the DC-X vehicle is to be returned to California for repairs so that the flight test program can be resumed.

[Info via Andy Reynolds, WD9IYT]

* VE3ONT ADDS 50 MHz EME *
==========
As a result of discussions at the recent meeting of the Central States VHF Society, the Toronto VHF Society (VE3ONT) has added 50 MHz to the list of bands to be used in the upcoming EME contest. 50 MHz will on the air on a non-interference basis simultaneously with 1296 MHz on Sunday of the first EME contest weekend.

VE3ONT will use the 46m (150') dish operated by the Institute for Space and Terrestrial Science at Algonquin Park (FN05xw). On 50 MHz, the antenna will be linearly polarized, and output power will be 1 kW.

UTC Date VE3ONT TX freq listening range approx. times

Oct 29 432.050 MHz 432.050 - 432.060 0645 - 1815 UTC
Oct 30 1296.050 1296.050 - 1296.060 0754 - 1844
Oct 30 50.100 50.100 - 50.105 0754 - 1844

Nov 26 144.100 144.100 - 144.110 0538 - 1645
Nov 27 144.100 144.100 - 144.110 0646 - 1713

Because the Algonquin dish has a 9 degree lower elevation limit, stations with horizon-only antennas in eastern North America will have a limited chance to work VE3ONT. VE3ONT requests that az-el capable stations in Europe and North America delay their QSOs with VE3ONT until after moonrise/moonset windows. This will allow the many horizon-only stations a better chance of making an EME QSO during the limited time available.

Link budget calculations show that 50 MHz stations with 10 dBd (6 elements or so) beams and 1 kW should be able to work VE3ONT off the Moon; smaller stations are urged to try as well.

Use of the dish at the Algonquin Space Complex is always subject to last minute preemption for non-Amateur purposes.

QSLs with an SAE to Dennis Mungham VE3ASO, RR 3, Mountain, Ontario, Canada, K0E1S0. Reception reports are also welcome. Send your log to the ARRL.

For further information contact Peter Shilton VE3VD, (905) 774-8766. Latest developments will be provided at the International EME Conference, Gottskars, Sweden, August 26-28.

Inquireing minds want to know.
>What is required for the Commercial Telegraph licenses? What is the
>difference between second and first class? (Is there a third class?)
>If I wanted to try this, what would I--as an Amateur Extra--have to do?
As an extra class ham you can forego the telegraphy exam but you still have to
pass the theory portion of the test. Sound familiar. After passing what
I think is the element 3 exam you can recieve the 2nd class
radiotelegraph license. Contact the FCC, they will let you know exactly
what you have to do.
>Thanks in advance for any information that may quench my
curiousity.
Hope this helps.

Millsboro (K3JL) is on 147.075. Dover is 146.970. Wilmington (146.73 and
146.955) are a bit of a long haul from Rehoboth without that 3-element beam
and 25 watts. The Salisbury, MD machine is atop a _tall_ tower, so you'd
probably get into it on 146.82. Weekends I hang out on the Dover machine
on 146.97.

It looks versatile to me. I would be interested in seeing one of these MFJ
transceivers used with the new Ten-Tec 6m (to 20m) transverter. Seems the
two would make a nice little package for these two bands. I operate very
successfully on 6m with 100 milliwatts (with a 3 element yagi at 20 feet).
So would imagine the 8 watts from the transverter would do quite nicely.
The MFJ rig surely can be tuned to 14.125 (to translate to 50.125, the SSB
calling frequency.

>Turning on a radio to *listen* does not produce more EM waves.

While I agree that jury is definately still out on biological
effects of RF. The speaker on the reciever at least is going to
produce EM waves (but probably not RF waves), if the reciever is
poorly sheilded it may emit all sorts of EM waves.
Unfortunately RF has become another issue like ionizing radiation
which many people get hysterical over before doing any homework.
However, taking reasonable precaustions to minimize your RF exposure
untill some more definiative answers come out does not seem
unreasonable.

The outgassing of from the PVC cabinet parts is potentially harmful, that can be offset by decent air circulation. Amateur radio is a largely inactive hobby with some stressful activities like 24 hour contesting and DX pileups and exscessive coffee drinking, try to offset those with regular physical activity and healthy sleeping and eating habits.

Don't work on your linear without disconnecting the power and discharging the high voltage supply, never climb your tower without a safety belt, don't string feedlines and antennas too close to power lines.

That should cover your station as you described it:)

Try anonymous FTP to "oak.oakland.edu". You will find several
morse programs in "pub/hamradio/mac/theory-and-morse". I have
used a program called "MorseTrainer 1.1.1". It is very good. I believe,
it is written by a Swedish guy.

Hi Vinod...

Yes, having an oscillator helps. Probably ONE of the best ways to learn to send is to try to imitate the code you hear sent from W1AW, on a tape, or from a computer program. By the time I got onto the air, in 1981, I had practiced sending every word, character, number, [not illustrations mind you] that happened to be on posters, etc. that I had tacked to the wall in my shack.

Then I started practicing sending text from books. I also listened to tapes and to code sent on the air. I imitated the best sounding code and with a straight key I could send some code that sounded like it came from an electronic keyer. [I can't do it now without some trouble]. I do use an electronic keyer and iambic paddles now and I use Mr. Farnsworth's methods most of the time and mainly just vary the spacing depending on how fast the other operator is sending.

Anyway Vinod, this is my input. I'm sure there will be others and putting all of them together will no doubt answer your question to your satisfaction.

supposed to be 18 WPM for the 5 and 13 tapes and 20 for 20...the 1991 tapes i have are all "fast" for all 4 test types for both speeds.

i guess if i was really dedicated, i'd find a sound board for the computer and run off some tests using MA at various settings....5@5 5@7 5@10, etc. and if we actually gave enough tests i would guess you'd see a pattern emerge where passing would be optimized.

'course, i'd also be tempted to replace the standard "qso" with something a bit more unexpected like the way some sequences seem to fit other apparently unrelated events (like that italian guy breeding rabbits discovered... leon fibonacci? or something like that...seemed like he lived in the 1200 block on timeline drive or something....) or talk about things like metric vs. english thread measurements - no reason for every test to be derived from the "novice boilerplate"....(evil grin) and there's always guys like Armstrong or Shockley to talk about.....maybe a test about the origins of teletype...

maybe there should be a calibration section on the tapes as well -- something like 15 seconds of 1 second ticks to check for correct recorder speed...after all someone with a 5% slow recorder could be letting people take 12.4 WPM or 19 WPM tests....8)

: to set up an experiential differential GPS system.

I had an idea. How about linking up a GPS with a cellular phone and
a large battery to power both for a couple of days. Then dial a number
on the cellular where you want the GPS to send it's location info and
drop the whole bundle into someone's car. Since GPS info can be used
with several very cheap street mapping systems (Delorme for one) you'll
be able to sit at home and watch them driving down the street on
your home computer. Should be able to do this cheap. A couple of
hundred dollars (with cheap GPS and cheap phone). I have no ideas
on keeping cellular costs down though. One thought would be to set
the phone to answer and power up the whole gizmo and then shut down
after a call is placed into it. You wouldn't get a continuous
signal but you'd be able to find where someone is on demand (if they're
within cellular calling range). Such a setup could last for a LONG
time with the proper battery.

From: depaul@spk.hp.com
Message-ID: <CuFrr5.BKH@spk.hp.com>
Source record: 261629

Hello.

Thanks for both of your remarks. I've read conflicting reports on this issue. I'm not the hysterical type, but felt that there should be a "gut" answer for my ham situation. It turns out that I did get what I was looking for:

Earl Morse writes me: "...the author made many readings around his home while operating his station at 100 and 500 watt levels. The highest readings were on the order of around 30 Volts/meter with most of the readings far below that. ANSI C95.1 suggests the following limits for human exposure to RF:

7 MHz...270 V/M
14 MHZ...135 V/M
21 MHz...90 V/M
28 MHz...67 V/M..."

You can always analyze data to your liking (which I did). Some questions one may ask:

1. What equipment was he using? (Etc...)
2. What were his measuring devices? (Etc...)
3. Are the ANSI safety standards too conservative/too liberal?

It's interesting how some of the die-hard smokers and the smoke industry are defending how the health risks are minimal and that nicotine is not addicting, etc...even to this day. I only wish that the ham community be given honest information on the subject.

Regards and again thanks for talking this out.

No,NO, NO! The speaker produces air PRESSURE waves which can at
sufficient volumes break the stalk like receptors in your ears
and result in hearing loss. Now that might be one of the few
established links to the danger of RF! And RF (radio frequency)
waves ARE EM (electro magnetic) waves at particular frequlencies
(radio). 'nuff said for now.

Greetings....just picked up the Kenwood TH-79A Dual Band HT....I'm impressed, well almost....my big questions is: KENWOOD...WHAT HAPPENED? One of the "BIG" features of being able to "skip" a memory channel in memory scan is not available....or at least I have not been able to find it! Like putting together a car and leaving out the motor. The one other feature I was looking for is being able to operate in full-duplex..."telephone style"....like I was able to do with the 78A....unless you use an earphone I find this feature useless! Other than these two items I REALLY DO like the 79A...nice size, very user friendly. Haven't had much of a chance to do anything else but would ber interested to hear from others who have purchased the 79A. Don't know if it will cross-band repeat or do 800Mhz! 73...Roger/N5IFH.

: I have seen other references to "beverage" in this group, but my
: handy-dandy Random House shows only the usual definition for
: the word. What does it mean in ham-ese?

A Beverage is a type of long-wire antenna, called a wave antenna because of the specific type of interaction between the electromagnetic wave travelling in space and the induced wave in the antenna. Beverages work extremely well at MF (160-meter country) because of the low reflection angles that those frequencies have from the ionosphere.

See also the ARRL Antenna Book, which devotes a significant amount of coverage to wave antennae.

(N.B. - I always thought it was spelled Beveridge, but that's not the way it is in the ARRL book... oh, well, ya learn something new every day!)

From clock.txt which is part of the xntp distribution

Time and Frequency Station CHU (Canada)

Information provided by Nick Sayer (mrapple@quack.sac.ca.us)
CHU is a radio station in Canada that broadcasts time of day information
sort of like WWV. CHU transmits on 3330 kHz, 7335 kHz, and 14670 kHz
using AM compatable single-sideband full carrier modulation. Between 31
and 39 seconds (inclusive) past the minute, CHU transmits a computer
readable timecode. This timecode includes time of day UTC, day of year
(1-366), Gregorian year, leap second warning, DUT (the difference
between UTC and UT1, which is an astronomical timescale. The difference
is an integral number of tenths of a second between -.9 and +.9. If the
difference exceeds .7, they schedule a leap second), and a Canadian
daylight time indicator.

The datastream is in the form of an AFSK datastream. The frequencies are
compatable with the Bell 103 standard: 2225 Hz mark and 2025 Hz space.
The carrier is active between 10 and 510 msec past the second. Each byte
of data is encoded as one start bit, 8 data bits and two stop bits.
There are ten bytes in each packet, and the last stop bit ends at
precisely 500 msec past the second. (1 start bit + 8 data bits + 2 stop
bits) 10 characters = 110 bits. Each bit takes 1/300 of a second (300
baud). So the whole code takes 366.66.. msec. 500-366.66... = 133.33...
msec. So graphically, each second looks like this:

```
000 050 100 150 200 250 300 350 400 450 500 550
| | | | |
^ ^ ^ ^ ^
1 2 3 4 5
```

1 - Ticking noise.
2 - 2225 Hz mark tone for 123.333 msec to allow modems to set up
3 - Data stream
4 - 2225 Hz mark tone for 10 msec to avoid false overrun of the stop
bits
5 - silence until the end of the second.

The datastream itself consists of ten bytes. There are two possible
formats at the moment: One for second 31 and the other for seconds 32
through 39. Each format has 5 bytes of data, then 5 bytes of redundancy.

The "A" format redundancy bytes are exactly the same as the data bytes. The "B" format redundancy bytes are exactly inverted (one's complement, NOT, XOR 0xff, etc) from the data bytes. This is how one can tell what sort of frame was received.

Once the data is received and the redundancy bytes are checked, the next thing to do is to swap the least and most significant nibbles in each byte. After doing all of this, the frames look like this:

A frame: 6d dd hh mm ss

ddd is the day of the year. hh:mm:ss is the time UTC. 6 is a constant. Each nibble is a BCD digit.

B frame: xd yy yy tt ab

d is the absolute value of DUT in tenths of a second. yyyy is the gregorian year, tt is the difference between TAI and UTC, a is a flag indicating canadian daylight time (contents of this nibble are undocumented at the moment), b is a serial number (this nibble increments whenever the B frame is changed), and x is a bitwise field:

```
8 4 2 1
| | | |
| | | +--- The sign of DUT (0=+).
| | +------ Leap second warning. One second will be added.
| +--------- Leap second warning. One second will be subtracted.
+------------ Even parity bit for this nibble.
```

A sample A frame as received from the modem might look like this:
36 56 21 51 53 36 56 21 51 53

Note that these numbers are in hex. This translates to the 365th day of the year (Dec 31, or Dec 30 in a leap year), 12:15:35 UTC.

A sample B frame as received from the modem might look like this:

19 91 39 72 00 e6 6e c6 8d ff

This translates to a DUT of -.1, year 1993, TAI-UTC=27, serial number 0 and no canadian daylight time.

2513. FM simplex on OSCAR subband

> Heard today on 2M simplex FM in the OSCAR subband: "The radio
> will operate single sideband, code wave and FM."

I hope somebody explained to this ham that the OSCAR subband is not the recommended place to operate terrestrial 2M simplex FM.

It's too bad that instruction manuals for amateur 2M FM transceivers don't list the frequency ranges that are "off limits" for terrestrial FM:

144.0 to 144.1 MHz Weak signal EME, etc.

144.1 to 144.3 MHz Terrestrial CW and SSB

145.8 to 146.0 MHz Satellite uplink/downlink

These sub-bands may not be enforced by law, but amateurs worldwide recognize these sub-bands as being reserved for specialized activities. And the 145.8-146.0 MHz band is officially designated for satellites in all three ITU regions.

Marc, I don't think it's a case of head-in-the-sand
it-can't-hurt-me mentality. as far as I've been able to determine,
there is *no* hard evidence that RF even at the NASI stated limits is
harmful. Neither is there hard evidence that it *isn't* harmful.
there simply are no hard and fast answers or rules.

There have been numerous legitimate research articles written
in teh subject (Broduer's work "The Body Electric" does not fall into
either category) and none have detrmined a definitive threshold for RF
exposure at HF. UHF and above is a different story, but HF effects
remain an elusive mystery.

My personal take on it is as follows: there may be effects at
HF, but given the body of research and the effort expended the effects
appear to be so small as to be negligible in comparison to other risks
I face.

Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.misc

Hi Folks,

I am in need of a Manual for a oscilloscope that used to be sold by BALLENTINE
(based in New Jersy) but not manufactured by them.
The model number is 1042A(I assume it means 10MHz); It is a 2-channel scope.

A friend of mine hinted to me that some BNK Precision scopes are similar to the
one I have and maybe an old issue of Popular Electronics might have published some
info about the Ballentine scopes.

I appreciate any information on how to get a copy(hopefully inexpensive!).

PS. This is my first posting to a news group; If this message offended some hamsters
for posting it here, I appologize for that.
I would appreciate any hints on where to properly post such messages next time.

Thanks,
TES

I know what you mean - JJY from Japan used to boom into Brisbane (VK4) along with WWV and WWVH. However, I didn't hear any others (c. 1982). Our time signal, VNG, was on 4.5, 7.5 and 12 MHz depending on time of day. Now, I don't know where it is since the Gov't gave it away. It was interesting though to listen to WWV and WWVH and hear the propagation delay difference. For a long time, WWV was the only source I had for propagation condx reports. Why did they never put that on WWVH as well?

This happened to me. Turned out to be a very fine crack in the
pcb where the squelch potientiometer attaches to the display board.

Took a while to find it but a quick blob of solder fixed it right up.

>From Tad Cook, KT7H
Seattle, WA August 12, 1994
To all radio amateurs

SB PROP ARL ARLP033
ARLP033 Propagation de KT7H

Solar activity is still low. Don't expect much improvement over the next few years. We can expect a slight improvement in the short term over the solar flux values in the mid seventies that we have had lately. Around August 21 through 24 the flux is expected to climb up to around 90.

Recently geomagnetic disturbances have been low, but currently we are experiencing slightly disturbed conditions from a recurring coronal hole. This may continue for a few more days.

Sunspot Numbers from August 4 through 10 were 21, 27, 29, 18, 18, 18 and 33, with a mean of 23.4. 10.7 cm flux was 75.2, 75.7, 75.3, 75.8, 73.8, 73.5 and 77.6, with a mean of 75.3.

The path projection for this week is from the center of the United States to Central Europe.

80 meters should be open from 0200z to 0430z, and 40 meters from 0030z to 0530z. 30 meters looks good from 0500z to 0700z, and again from 2230z to 0130z. 20 meters should be open most days from 1830z to 2330z, with the best time around 2130z or 2200z. The bands above 20 meters do not look good at this time.

FAR scholarships awarded

The Maryland-based foundation for Amateur Radio has announced the
1994 winners of the 50 college scholarships that it administers. The
top, 2000 dollar(s) winner was Extra Class licensee Craig A. Gullickson,
KC6CEX, 20, of Fresno, California.

Awarded a 1200 dollar(s) scholarship was 17-year-old Stefnee Lindberg, N0ONP,
of Kansas City, Missouri, an Advanced class licensee.

20 students received scholarships of 1000 dollar(s).

These scholarships are open to all radio amateurs meeting the
qualifications and residence requirements of the various sponsors.
The non-profit Foundation represents more than 50 clubs in Maryland,
northern Virginia, and the District of Columbia.

For more information and application forms for 1995 scholarships

Just curious, but does anyone know who is responsible for producing the
programs and writing/editing their content? I'm just wondering who's
in charge of the U.S. Propoganda Machine. This might explain why so
people outside of the United States hate Americans. It's because our
radio propoganda is so badly produced.

Never let it be said that I put things away when I'm done with them...

I just happened to have the January, 1982 issue of QST sitting on the floor next to me. On the cover is a colorized version of a photo of a Beverage antenna from the November, 1922 QST. QST reprinted the original article with a commentary by Doug DeMaw on the not-quite 50th anniversary.

H. H. Beverage, ex-W2BML, published the original article in QST on the antenna that came to take his name. It's a great, low-noise receiving antenna for MF and lower frequencies (it works well with groundwave, low-angle signals, but it's pretty bad with sky wave signals.)

It's not a good antenna for city dwellers--at a minimum, the antenna should be at least a wavelength. It's easy to set up, though--just string a really long wire 10-20 feet above ground, terminate the far end with the proper resistive load, and *presto*, you can hear everyone on 160 meters. well... :)

H. H. Beverage and Doug DeMaw, "The Classic Beverage Antenna, Revisited," QST, January, 1982, pp. 11-17.

H. H. Beverage, "A Wave Antenna for 200-Meter Reception," QST, November 1922, p.7. See also "The Wave Antenna, a New Type of Highly Directive Array." in the Transactions of the AIEE, 1923.

Here is a summary of news items covered on Edition #72 of "This Week in Amateur Radio", North America's satellite-delivered audio bulletin service, for the week ending 19-Aug:

1. FCC Awards PCS Licenses After Successful First Spectrum Auction
2. Vice President Gore Presents Award to FCC for "Reinventing Government"
3. Amateur Radio Society and IARU Leaders Meet in Germany
4. CQ/50 Award Guidelines and Rules Released for Magazine's 50th Anniversary
5. "The RAIN Dial-up" from Chicago
6. Phase 3-D Satellite Spaceframe Received at Orlando Facility for Assembly
7. "EZSATS" with Dave Mullenix, N9LTD
8. "Gateway 160 Meter Net Report" with Vern Jackson, WA0RCR
9. Weekly Propagation Forecast with George Bowen, N2LQS
10. "Amateur Radio Newsline" - Edition #887 from Los Angeles

Funding for the program's transmission, uplink, and production expenses was provided this week by a grant from the Blue Ridge Video and Digital Society of Roanoke, Virginia, where "This Week in Amateur Radio" is heard on the WB4QOJ repeater on 147.21 MHz, serving Roanoke, Central Virginia, Southeastern West Virginia, and North Central North Carolina. Funding for "Newsline" was provided by Brian Litzenberger, N0PMZ, of Garden City, Kansas.

"This Week in Amateur Radio" is a weekly amateur radio news and information service, in audio newsmagazine format, which is produced by Community Video Associates, Inc., a non-profit, charitable, tax-exempt foundation based in Albany, New York. The program is carried on the "Omega Radio Network" each Saturday at 7:30 PM (EDT) on the Galaxy III commercial communications satellite, transponder 17 (9H), 5.8 MHz wideband audio (4.040 GHz), located at 93.5 degrees west longitude in geosynchronous orbit, and can be heard on various VHF/UHF repeaters throughout the United States and Canada, as well as on 160 meters at 1860 kHz. Contact your local amateur radio club or repeater operator if "This Week in Amateur Radio" is not being heard in your area.

Production and transmission expenses are underwritten by contributions from repeater system operators, amateur radio clubs, and individuals. For further information, contact Stephan Anderman, WA3RKB, at 518/877-7374, or George Bowen, N2LQS, at 518/283-3665. You may also reach them via amateur packet @ WA2UMX.#ENY.NY.USA.NA and on various landline bulletin board services.

Does anybody know of a construction article for a "general purpose" TNC?

These are my reguirements:
1) Standard serial connection. (I have 4 different computers and would like to be able to connect to all).

2) An internal processor of some type to minimize the overhead on the computer.

If these are too strict, please let me know.
Thanks.

> pretty straight forward)

Just what theConcerned Amateurs group was seeking after certain people
cheated their way onto "Council" in April (thereby causing all this
legal mess.) No names of course, because that would be defamatory :-)

>(ii) Resolve that the newly elected Council NOT be required to retire
> until the Annual General Meeting in 1996.

Fine, as long as none of the above-mentioned people get in again.

Maybe then we can get back to the hobby, and those shortwave listeners
(with callsigns) who've caused this mess will find some other way
to occupy themselves..

>looked like.

That's not surprising. Two things are at work here. First there is
almost certainly a voltage regulator circuit in the radio to feed
the digital components. It's pass element will act like a variable
resistor depending on the input voltage. That, when summed with the
load presented by the radio circuitry, will present a near constant

current load on the source.

The second factor is a bit more subtle. As the voltage rises, active devices come into their linear range and their quiescent current becomes determined primarily by the ratio of the bias elements. As long as drive is absent or constant, their current draw will remain nearly constant over a fairly large supply voltage excursion.

Gary

The 3-Hr Ap Indices for 11 AUG 94 are: 17 14 11 13 16 12 11 13
Greater than 2 MeV Electron Fluence for 12 AUG is: 3.1E+07

SYNOPSIS OF ACTIVITY

Solar activity was very low during the past 24 hours.
However, new Region 7765 (S11E17), a magnetically complex
D-type group, emerged rapidly after 12/0000Z. It has produced 5
subfaint flares, some with low-level x-ray enhancements. Two
other H-type spot groups are visible on the disk. A dark
filament seen in He 1083 nm near N25E25 on 10 August was
considerably reduced on today's image. There were no reports of
eruptive limb activity.

Solar activity forecast: solar activity is expected to be
low based on a good probability of C-class x-ray flares from
new Region 7765. If rapid growth continues, there is a chance
of an isolated moderate x-ray flare.

The geomagnetic field has been mostly unsettled for the
past 24 hours, although isolated quiet and active periods were
also observed. Moderate levels of energetic electron fluxes
were observed at geosynchronous orbit.

Geophysical activity forecast: the geomagnetic field is
expected to persist at primarily unsettled levels with isolated
periods of both quiet and active conditions. Energetic electron
fluxes are expected to decrease toward normal background values.

Event probabilities 13 aug-15 aug

Class M 10/10/10
Class X 01/01/01
Proton 01/01/01
PCAF Green

Geomagnetic activity probabilities 13 aug-15 aug

A. Middle Latitudes
Active 30/30/30
Minor Storm 15/15/05
Major-Severe Storm 05/05/01

B. High Latitudes
Active 40/25/10
Minor Storm 20/10/05
Major-Severe Storm 05/05/01

HF propagation conditions were near-normal over all but
the high latitude auroral regions where a few periods of
below-normal propagation were observed due to enhanced levels
of geomagnetic and auroral activity. Near-normal and improving
propagation is expected to continue over the next 3 days. If
Region 7765 continues to evolve, daylit paths may experience
isolated periods of short-wave fadeouts. Slightly enhanced
ionizing radiation from this new active region may also
gradually enhance MUFs over the next week.

All times are in Universal Time (UT). Characters preceding begin, max,
and end times are defined as: B = Before, U = Uncertain, A = After.
All times associated with x-ray flares (ex. flares which produce
associated x-ray bursts) refer to the begin, max, and end times of the
x-rays. Flares which are not associated with x-ray signatures use the
optical observations to determine the begin, max, and end times.

Acronyms used to identify sweeps and optical phenomena include:

II = Type II Sweep Frequency Event
III = Type III Sweep
IV = Type IV Sweep
V = Type V Sweep
Continuum = Continuum Radio Event
Loop = Loop Prominence System,
Spray = Limb Spray,
Surge = Bright Limb Surge,
EPL = Eruptive Prominence on the Limb.

You aren't going to be able to get a GPS and cell phone for a couple hundred dollars. The cheapest GPS receivers are around $400, and so are cell phones unless you roll their cost into a long term service contract. And monthly and per minute cell phone charges will mount up fairly rapidly. By using packet radio, amateur or commercial, you can send position updates on a regular basis without incurring quite as much cost.

DeLorme Mapping and City Streets are a couple of commercial map systems that work with GPS. However, APRS (Automatic Packet Reporting System) is in some ways better. While it lacks the friendly user interface of the commercial products, and it's pre-made map databases are skimpy, you can make your own maps, and it works with local and remote GPS receivers (using packet UI frames for the latter). It also supports other information about the remote sites such as range and bearing data from DF equipment, and arbitary text messages.

However, what many of us want is *differential* GPS. The Coast Guard, FAA, and others send out position deltas from a fixed benchmark receiver that are received and used to correct the reading of the local GPS receiver. These transmissions are either at MF or VHF depending on the system. A special receiver is required, and either a GPS receiver designed to work with differential signals, or a PC that can take the timestamped position reports and reconcile them via software, is used to give a true position. This method removes the deliberate SA jitter, and other error sources such as varying atmospheric propagation factors,

from the position data. This allows much greater precision in determining location than raw GPS alone.

It would be nice if the APRS author would support this mode in his software. Some of us are willing to set up benchmark receivers on the amateur bands. That timestamped data could be used to correct the positions reported by the rover receivers over packet.

That depends on the *people* using the repeater system. Some conversations are quite interesting, others less so. It's what *you* make it rather than the mode you use that makes for interesting or boring operations.

>Packet with keep you busy if you
>have access to some good servers in your area.

Packet can be interesting, it's normally done with FM radios though, so the multimode doesn't come into play here either. Packet is also a very cooperative venture, depending on the *people* involved, it can be great, or boring.

>I find SSB and CW an
>interesting challenge on 2m. It does require a horizontally polarized

>something to grow into. Good results take a good station. But it is very
>possible work out 600 miles on lite tropo enhancements and out about 1400
>miles using meteor bursts, sporadic-E, FAI, etc.

Weak signal work *can* be interesting, though it's usually brief periods of excitment separating long boring periods of no activity. In general, very little content is passed, and contacts are interesting mostly for the odd quirks of propagation they illustrate. Having a multimode for this purpose is a good way to start, but if you're serious you'll want something better than the commercial offerings. A transverter in front of a top notch HF rig is a good way to go, and of course, improving preamps and antennas will occupy much of your idle time. Building amps can occupy most of the rest.

Another use for a multimode is the amateur satellites. Here you'll find contacts that range from the contentless DX types of the weak signal crowd to the full blown technical or non-technical ragchews heard on repeaters. Plus there's the spice of having HF-like range and the fillip of using a spaceborne asset. And there's a moderate technical challenge as well in erecting adequate antennas and tracking the satellites.

>Anyway, something you may want to check into incase you buy only ONE rig.
>I found HTs just didn't have the power I needed to work stations without a

>repeater and the repeaters were always busy when I wanted to operate. The
>ARRL has an informative book titled something like "VHF: beyond the
>horizon".

I agree that a HT is terribly limiting, and wouldn't recomend it as a
first rig to anyone. However, the repeater spectrum sits idle most of
the day. There's usually always room for you to have a QSO. Even on
busy repeaters, joining a conversation is almost always welcomed.
Contacts are what *you* make them. Have something interesting to say,
and people will want to talk with you.

Actually, he's right. Speakers do produce time varying magnetic
fields from the voice coil. These are mostly induction fields
with little actual EM radiation. However, that *is* the kind of
low level field that researchers are currently studying to determine
if they have effects on biological systems. In this regard, the
air pressure waves also produced by speakers can be viewed as merely
an annoying *side effect* of their magnetic induction field production.

I'd shield that sucker. Not only is it a source of EM radiation
leakage on frequency, it's also a source of harmonic leakage,
and a high voltage hazard. Good engineering practice says such
tuners should be well shielded. As amateurs, we're required to
follow good engineering practice by Part 97.

So, that is what the third wire is about. I guess I am hosed. I can just
drop that function though. I bypassed the things and it seems ok. They did
not seem to talk together anyhow. I can't get them away form the wiring, no
way. I gues maybe it may still work since the carrier must be a lot lower
frequency than the 40 mtr energy. Thanks for the information.

>
>Or tune the radio to VOA?

Fear not, fellow residents of the United States. The Radio Police really will not nab you if you listen to VOA shortwave broadcasts or download files from our public Internet server.

VOA's parent agency, the United States Information Agency, was established by the U.S. Congress shortly after the Second World War to provide information to other countries. (VOA itself antedates USIA; it was created in 1942 to counteract enemy propaganda.) Our legislative charter expressly prohibits us from seeking a domestic audience for our program materials. As others have pointed out previously in this thread, Congress apparently included the prohibition in order to make certain that the U.S. government could never convert USIA communication facilities into the kind of internal propaganda apparatus operated by the German government during the war.

Consequently, VOA radio programs, Worldnet television and USIA publications are intended exclusively for recipients in other countries. Congress has enacted a few statutory exceptions that permitted us to distribute specific programs to a domestic audience -- the most prominent exemption was for an award-winning film documentary on the presidency and assassination of John F. Kennedy -- but the general prohibition remains in effect. However, it only restricts what we as a government agency may do, not what United States residents may hear or watch or read.

To get our programs to other countries, we obviously must use a number of transport mechanisms that are publicly accessible inside the United States: shortwave radio transmissions, satellite transponders and the Internet. We do not encourage those of you within the United States to listen to or watch these programs as they are transmitted to other countries, but no one in the government objects if you do. (And even if we did, it would be unconstitutional for us to try to stop you.)

On the other hand, I do strongly recommend that both residents of the United States and residents of other countries avoid listening to the BBC World Service, as there is mounting medical evidence that this can corrupt your English pronunciation. . . .

I'm intrigued about the methods of testing CW proficiency in the US. Is there both receive and transmit testing?

In VK, we sit both. The receive test is a straight copy-the-plain-language test. If you copy it with below maximum errors, then you pass.

Everyone should have an idea occasionally... :=)

Well, this is, unfortunately, not a new idea. The similar systems I'm already
familiar with sell for ~$2000, which tells me that they are costing about $1k
for hardware PLUS s/w and R&D.And don't have much markup.

>You aren't going to be able to get a GPS and cell phone for a couple

>quite as much cost.

Actually, if you shop carefully, the DGPS without a fancy display costs $318.
Quantity 1. It's a Motorola VP Encore core modure, and it runs on 5 VDC
(regulated), puts out TTL levels, and can receive RTCM-104S differential
updates with Option B installed (for no cost, I might add!). Further, with
Option B, it will put out the differential correction data, acting as a
reference station, albeit in Motorols Proprietary Binary format. The
developers' manual has the full data format, making translation to the
standard format pretty straightforward.

The cellphone could be the hard part, from a cost perspective. I've not
looked into that, because there aren't too many cell sites near the ranch I'm
where I'm putting GPS's on cows.

>DeLorme Mapping and City Streets are a couple of commercial map

Very true. In fact, it's seriously impressed the GIS institute here at Texas A&M (Nice Job, Bob!).

>However, what many of us want is *differential* GPS. The Coast Guard,

>and other error sources such as varying atmospheric propagation factors,
>from the position data. This allows much greater precision in determining
>location than raw GPS alone.

Er. Ah. See above. Differential is getting easier and cheaper. A local ham club could go together, get a cheap GPS core, throw together an embedded PC clone for translation, and broadcast the results on packet. Now, if you want to get really fancy, use carrier-phase to get the roaming units a little smoother, AND incorporate DGPS.

>It would be nice if the APRS author would support this mode in his
>software. Some of us are willing to set up benchmark receivers on
>the amateur bands. That timestamped data could be used to correct
>the positions reported by the rover receivers over packet.

And, of course, if you want to, one can log DGPS corrections over a local area and post-process the logged fixes from the mobile units, to give DGPS corrected data. That's one of the standard methods used today. I don't personally think APRS is the appropriate place for DGPS post-processing corrections...

The AC-powered/slaved detectors I have seen use a third signal wire to
interconnect units. No idea what the format is, but I suspect it is
really crude (raw 120vac?) & thus can be filtered.....

Where can I get more information about this device and the developers'
manual? This sounds very interesting!
>
>The cellphone could be the hard part, from a cost perspective.

In California, various places are selling the bottom-of-the-line Motorola
portable cellphone for $100, with no activation required. (CA has a law
prohibiting anyone from requiring the purchase of cellular service with
a phone. However, you do get a VERY nasty look from the salesperson
when you say "No, I just want the phone.") It's almost getting to the
point where it's worth investigating what it would take to put one of
those phones on the 900 MHz ham band.

Incidentally, one of the earlier posters in this thread mentioned tracking
vehicles using the GPS/cellphone system. We had a demonstration here a
couple of months ago in which a ham put a GPS/APRS system in his wife's
car, and produced the resulting map for the local packet users group. The
map provided an every-two-minutes location for the car for an entire
day.

>I know this question has probably been ask a hundred times before but IJam
>new to amateur radio, and internet, and IJwant to know exactly what
>frequencies you can operate on with the no code license. Such as 2m,
>220mhz, 440mhz 6m, etc..?

see any of the study guides for an answer on this one....the technician
license will let you operate on all frequencies amateurs can use above 30 MHz.
that's more frequencies than i want to type in just right now...8)

>Also, what brand(s) of handheld and desktop
>radios are the popular ones. I want something that is going to be reliable
>and have user friendly features.

for HT type radios -- low cost: Radio Shack HTX-202 when it's on sale (call
Marymac for a discounted price...). I had one (was stolen) and it performed
excellently - outperforming big name radios in many environments. I also have
a Yaesu FT-530, FT-727R, FT-109RH. the 2m FM base radio is a Yaesu FT-2400H.
Probably any of the current crop are ok for basic operation..the FT-2400 has
been replaced by the FT-2500 with a better front panel layout, i think and
there's a UHF twin called the FT-7400 (i think) that's next on the shopping
list.

>One more thing, I need recommendations on
>amateur radio and satellite magazines.

ham radio: the usual suspects:
CQ, 73, QST, Communications Quarterly, Worldradio, etc.
off hand i don't have the name of AMSAT's publication that would probably be
the thing to have for amateur satellite work...

* INTRODUCING 'FAISYN' FILTER SYNTHESIS PROGRAM FOR MSDOS *
* *
*****************************************************************
```

faisyn20.zip Electronic Filter Synthesis Program

FAISYN is a low cost, effective alternative to expensive commercial filter synthesis packages. The program has be used to design lumped element filters and diplexers from 10's of KHz to 1.5GHz and is the result of many years experience in filter design. Designers know that filter design is often an iterative process. Tedious number grinding is sometimes required to optimize a design. FAISYN eases the burden by allowing the designer to quickly synthesize a variety of circuits that can be simulated and compared using your favorite circuit simulator (FAISYN currently supports PSPICE-TM Microsim, MMICAD-TM Optotek and TOUCHSTONE-TM HP/EESOF circuit formats).

Special Requirements: None

Shareware.

Faisyn was developed by:

Kevin Faison
Carriage House Engineering
16 W. Pleasant Hill Rd.
Owings Mills, MD 21117

You can get FAISYN20.ZIP from one of the following sources:

1. I just posted a UUENCODED version (2-parts) to comp.binaries.ibm.pc

2. I have just uploaded the program to the SIMTEL collection. It should appear there, and on it's mirrors soon in /msdos/electric.

3. I tried to upload it to bode.ee.ualberta.ca, but for some reason it appears to be down today. Look for it there soon.

Bid:$RACESBUL.336
Subject: RB 336 EMA /Volunteer Partnership

RACESBUL.336 OPS - EMA /Volunteer Partnership
RELEASE DATE: July 25, 1994

It takes an unusual volunteer to provide dedicated and competent service to emergency management agencies, EMA. Such volunteers must be ready to appear on short notice, stay at their assigned post and duties until relieved, be willing and able to travel where needed. They may even provide the necessary equipment at their own expense. They cannot be "amateurs" in the sense of pursuing a hobby. Instead they must devote a great deal of time and energy to become as proficient as paid staff. The agency they work with must be able to depend upon their availability when needed, their skill at assigned tasks, and their ability to mesh into the overall disaster response exactly as is expected of paid staff. Fortunately there are people, ready, willing and able to serve in such capacity.

Such a pool of qualified volunteers is a resource, the value of which often becomes overwhelmingly evident when a major emergency threatens to exceed the capabilities of paid staff and equipment. Like any other resource, volunteers must receive adequate training, needed facilities, and the attention and general upkeep that is accorded any other resource. Recognition of the contribution to the tasks at hand should be as professional as anything else in the relationship. As with any staff, they respond to honest reassurance that their work is recognized and respected; however, their service will be quickly lost if they are merely tolerated, or seen as a nuisance.

If the EMA makes a positive effort to integrate this nominally "free" resource, allocate time, energy, and people to use it to best advantage, provide its necessary resources, and develop it as they do with any other resource, it develops a relations hip with an open ended potential. It also extends agency capabilities in many directions while providing satisfaction to the volunteers for their time and efforts.
Bill Musladin, N6BTJ, retired Chief State Radio Officer.

RACESBUL.337 SUBJECT: TEC - Why Packet Radio?
RELEASE DATE: August 1, 1994

QUESTION: Is it important, or necessary, to have packet
radio?
RESPONSE: Yes, with packet radio (digital data) you can
access a world of data you may never achieve in any other way.
For that reason, it is recommended that every EOC and/or
communications center have a packet radio terminal, which
consists of a radio, a terminal node controller, and a digital
communications terminal (computer) and printer. Once the unit is
operational and accessible to a local bulletin board system
(BBS), it can be left on all the time so that any traffic
addressed to RACES will be automatically transmitted to
unattended government terminals. A licensed Amateur Radio
operator does not have to be in attendance to RECEIVE traffic.

Also, keyboard-to-keyboard communication is quite usable
in emergency and temporary communications systems where it can be
accomplished either direct or through no more than one mountain
top relay. A good volunteer communications unit can put such a
relay (digipeater) where none normally exists for the duration of
the emergency. A good communications unit is one that can
establish an emergency system that is never dependent upon
individuals or their call signs. The people may come and go but
the system must stay in place until demobilization. Just make
sure the system will remain intact for the duration of its need
and that it is not dependent on the presence of a particular
person.

Packet radio has earned its highest praise during major
incidents like forest fires, earthquakes, floods, etc. California

State OES volunteers regularly issue one or more SITREPS (situation reports) daily to all affected agencies and jurisdictions. It is transmitted via the Amateur Radio packet system to all packet Bulletin Boards in the Western United States. Many fire departments, for example, rely on these updates.

Necessary to the overall formula for success is a state emergency management agency committed to actively promoting, using, and providing ongoing management and leadership in the utilization of communications volunteers in government service. Unfortunately, not all states support and participate in this role. However, our experience proves that the cost is extremely low for the benefits derived. Packet radio communications has been just one of them.
EOM

RACESBUL.338 SUBJECT: MGT - EMA Assistance Available
RELEASE DATE: August 8, 1994

These bulletins serve multiple purposes both for the
civil defense or the emergency management agency and the program
participants.

For the agency a major purpose is to assist it in the use
of emergency communications volunteers as unpaid staff. How to
best use them can be very satisfying. Having qualified extended
staff (albeit it unpaid) can provide astonishing benefits to the
agency and the community.
Material and other assistance about this is available
upon request. Assistance includes on-site seminars for local
government, the emergency management agency and the program
participants. Materials range from policy and guideline
suggestions to actual emergency communications plan preparation
customized to the local needs. A particularly valuable resource
is the State OES manual "Establishing and Maintaining an
Emergency Communications Reserve", which is based on the
information bulletins to Emergency Management Agencies issued by
the Auxiliary Communications Service from l985-1993. [Free to
California jurisdictions. Others may request a copy with a $12
check payable to the State of California.]

For the program participants a major purpose is to discover how
to function as "unpaid staff" of the agency alongside the paid
staff; i.e., how to become an integral part of the agencies
day-to-day activity. How to benefit both the participant and the
agency by skills other than "just operating a radio", and the
unheralded rewards and deep sense of a worthwhile contribution
that ensue. With the expansion of Public Safety communications

systems there is a real need for augmentation of staff (albeit unpaid) capable of providing maintenance and operation of these systems during extended emergencies. The use of Public Safety systems by program participants can range from augmenting 911 systems to the emergency installation, maintenance and operation of local government radios.

One example of such an integrated emergency communications program is illustrated by the publication "State of California Governors Office of Emergency Services Emergency Communications Reserve, the Auxiliary Communications Service". How it is implemented and designed is set forth in the 1994 plan of the same title distributed to California counties and State and Federal agencies without charge. Others may request a copy with a $11 check payable to the State of California. Mail to Office of Emergency Services, ACS Program, Telecommunications Branch, 2800 Meadowview Rd, Sacramento, Ca 95832. For more information call or write: Stan Harter or Cary Mangum 916-262-1600.

Bulletin 339 MGT - Solving the Impossible 1/2
Release date: August 15, l994

Experience can be a very hard teacher at times. One such
experience that leaves a lasting impression on emergency
personnel is that there is never sufficient communications
capability in a major disaster situation, especially in the
earliest stages. As a result, forward looking government
emergency response agencies have learned to use trained volunteer
communicators to supplement their full time resources from the
onset of the situation, just as they do volunteer fire and law
enforcement personnel.

However, a major principal involved in this process is
that the effectiveness of the communicators is in direct
proportion to how well they have been trained by and integrated
as part of the parent government agency. The emergency
communications reserve cannot be "created and then left to
flounder". Its key personnel (the radio officer and assistants)
must be thoroughly familiar with the day-to-day affairs of the
agency. They are similar to other employees, albeit unpaid, in
that they must know IN ADVANCE what is expected of them and how
things are to be done. In an emergency there will be no time or
personnel to bring them up to date on agency procedures,
processes and expectations. Ideally, the only difference between
the unpaid volunteer and the paid staff is the volunteer's unpaid
status and the intermittent nature of their utilization.

Although unpaid communicators are an expense to the
parent agency (in that their familiarization and supervision
involves both time, energy, space and equipment) in literally
thousands of major emergencies the cost of insuring an effective

reserve for the next major emergency is minuscule when compared
to their often priceless contributions to an effective emergency
response. They have made a hero of the emergency management
agency in countless situations with selfless dedication to
providing communications that was otherwise considered to be
"impossible".
EOM (CONTINUED NEXT WEEK)

NOTE: The Effective Sunspot Number for 12 AUG 94 was 20.2.
The Full Kp Indices for 12 AUG 94 are: 3+ 4- 4- 2+ 3+ 3- 3o 3+
The 3-Hr Ap Indices for 12 AUG 94 are: 18 25 21 10 18 11 16 18
Greater than 2 MeV Electron Fluence for 13 AUG is: 9.2E+07

SYNOPSIS OF ACTIVITY

Solar activity was low due to a C4/SF flare at 1744Z from
Region 7765 (S11E03). This region continued to emerge and
exhibited mixed polarities. A delta may be forming near the
center of the Region. Several arch filament systems were
reported.

Solar activity forecast: at a minimum, solar activity
should be low. Continued growth in Region 7765 bodes well
for the production of small M-class flares.

The geomagnetic field was mostly unsettled to active.
Minor storm conditions were experienced at most sites between
0300-0600Z. Energetic electron fluxes were at a moderate level
for most of the period, but became high at the end of the
period.

Geophysical activity forecast: the geomagnetic field
should be mostly unsettled for the next three days.
Intermittent active periods are probable and isolated minor
storm intervals are possible.

Event probabilities 14 aug-16 aug

Class M 40/40/40
Class X 05/05/05
Proton 01/01/01
PCAF Green

Geomagnetic activity probabilities 14 aug-16 aug

A. Middle Latitudes
Active 35/30/30
Minor Storm 15/10/10
Major-Severe Storm 05/01/01

B. High Latitudes
Active 40/30/30
Minor Storm 20/10/10
Major-Severe Storm 05/01/01

HF propagation conditions were near-normal over most
equatorial to middle latitude regions, although the low and
equatorial paths have experienced some problems associated with
sporadic-E during sunrise/sunset. High and polar latitude
paths observed moderate to strong signal degradation between
about 06:00 UTC and 09:00 UTC due to polar substorm activity,
but recovered to near-normal levels after 18:00 UTC.
Conditions should gradually improve over the next several days.
The enhanced solar radiation primarily associated with solar
Region 7765 should begin strengthening the ionosphere slightly
and may raise MUFs a bit over the next week. At the same time,
there is a fair chance that this region might produce a minor
M-class flare capable of producing short wave fadeouts (SWFs)
over daylit paths.

NOTES:
All times are in Universal Time (UT). Characters preceding begin, max,

and end times are defined as: B = Before, U = Uncertain, A = After.
All times associated with x-ray flares (ex. flares which produce
associated x-ray bursts) refer to the begin, max, and end times of the
x-rays. Flares which are not associated with x-ray signatures use the
optical observations to determine the begin, max, and end times.

Acronyms used to identify sweeps and optical phenomena include:

II = Type II Sweep Frequency Event
III = Type III Sweep
IV = Type IV Sweep
V = Type V Sweep
Continuum = Continuum Radio Event
Loop = Loop Prominence System,
Spray = Limb Spray,
Surge = Bright Limb Surge,
EPL = Eruptive Prominence on the Limb.

David,
When I was learning CW, I used a program called SuperMorse. You should
be able to download it off just about any BBS.

Good luck and congrats on passing your test! When you get your ticket,
drop me a note on packet to say hello.

Erich,

There are several MAC shareware programmes which will undo .zip
files. Check on CI$ or AOL. Zipped files are no longer a problem
for mac users.

The following is a QST

Radio Shack says its time to replace the General Mobile Radio Service with a license free Family Radio system, the FCC goes full speed in regulatory enforcement and changes to ham radio in the United Kingdom. These stories and more on Newsline report number 887 to follow.

(*****
RADIO SHACK PROPOSES NEW RADIO SERVICE

The Radio Shack Division of Tandy Corporation has filed a petition before the FCC to create a new, license free radio service in the old General Mobile Radio Service Band. The Family Radio Service as Tandy calls it, would use 16 channel, 500 milliwatt radios operating between 462 to 467 MHz. Tandy says that the current licensing requirement for GMRS operation an impediment. It says that the ultimate success of a new Family Radio Service hinges on it being unlicensed. The consumer electronics giant also asserts that replacing the General Mobile Radio Service with its unlicensed Family Radio Service will mean a significant saving to the government in administering the service. About two years ago, Radio Shack announced that it would be selling GMRS transceivers. The low power entry level units were crystalled on 462.7125 Mhz while the two channel version had an empty slot for the end user to choose a channel pair. At that time Tandy touted the radios as a step up from the 49 MHz kiddie talkies and the crowded 27 MHz Class D Citizens Radio band. But purchasers still have to obtain a GMRS license before using the units. Tandy Radio Shack now says its time to end the need for tight government control so that family units who need reliable short range communications can have it immediately, and a reasonable cost.
As we go to press, the FCC has not yet issued any rule making designation to the Tandy Radio Shack Family Radio Service request.

MIAMI OFFICE CLOSES TWO PIRATE STATIONS

Lots of enforcement news from the FCC this week. First, Engineers from the Miami FCC Field Operations Bureau Office have

put a pair of pirate broadcast stations off the air. They learned about one of the stations when they responded to a complaint by a television viewer who claimed to be receiving interference to Channel 6 from a neighbor with an unlicensed radio station. The FCC investigators positively identified the pirate operator in Perrin, Florida, transmitting music on 88.3 MHz under an adopted call sign WBASS. In the course of monitoring this station, the FCC observed another broadcast on 91.9 MHz tracked to Homestead, Florida. This station, identified as WGBC, transmitted mostly Haitian religious music. Both stations were shut down. The FCC says that the operators of both stations will receive very heavy fines.

(*****
TAXI CAB COMPANY INTERFERES WITH THE FBI

The Buffalo FCC office has cleared up a case of interference to the Federal Bureau of Investigation. The FCC was contacted by the local FBI which complained of interference to one of its VHF repeater stations. FCC monitoring picked up a signal. It consisted primarily of data transmissions only 10 kHz away from the input frequency of the FBI's station. Bearings taken by the FCC indicated the signal was coming from Canada. FCC engineers contacted the Canadian officials who determined that the only data transmissions of the type interfering with the FBI were being used by a Toronto cab company. The cab company was contacted and found to have a defective transmitter. There was no malicious intent. After repairs were made, the interference problem was solved.

(*****
FIRE DEPARTMENT ECHOES

The San Francisco Office of the FCC literally took to the air to stop a strange interference problem to the Contra Costa Fire Department. The Fire Department complained that it was receiving interference in the form of a deliberately retransmitted echo on its low-band VHF channel from a station that was retransmitting their signal five seconds after it was made.
Because of the severity of the disruption to safety-of-life communications, the FCC prepared what it calls an admonition statement. We won't go into the details of what was said but it was definitely effective. Soon after it was read on the air the interference stopped. Later, the local TV news heard of the problem and aired an interview with the FCC Regional Director who explained what was done and why.

(*****
INTERFERENCE TO VESSELS IN LA AREA

Further south, the Los Angeles FCC Office recently received a complaint from the Coast Guard station at San Pedro. It reported that ships in the area were receiving interference on Channel 16.

That's the marine emergency calling channel. FCC engineers used mobile direction finding equipment. They tracked the interfering signal to a nearby trucking company. FCC investigators determined that there were no marine licenses issued to the company. They shut down the unlicensed radio immediately.

(*****
UK CHANGE

Some good news and some bad news for hams living in the United Kingdom. First the good. Effective immediately, the UK Amateur and Amateur Novice Licence rules have been liberalized by the nations Radiocommunications Agency.
Holders of the full Amateur Class A Licenses may use 26 dBW -- that's 400 watts -- on the entire of the sub-band of 1.81 to 1.85 MHz. This removes the power restriction on 1.81 to 1.83 MHz. But the power limit for 1.85 to 2 MHz remains at 15 dBW. These same Amateur Licenses may now also use 26 dBW between 50 and 51 MHz. The maximum permitted power between 51 and 52 MHz is still 20 dBW. Next, the Effective Radiated Power level and antenna height restrictions have been removed from the whole of the 50 to 52 MHz band, allowing the use of any antenna. Finally, Maritime Mobile is now permitted on 50 MHz.
No for the bad news. All UK Amateur Radio operators are now required to notify their local Radio Investigation Service office of unattended digital operation. This new restriction became necessary following a number of problems with unattended operation.
The final change, which also affects all licensees, concerns logs which are kept on a computer. A licensee must now be able to provide a print-out of the log to the Radiocommunications Agency on demand.

(*****
SAREX AIR SHOW CONTACT

Approximately 100,000 attendees at the Aerospace American annual air show in Oklahoma City heard a 2-way SAREX contact on July 17. Present at the air show was retired three star Air Force Lieutenant General Tom Stafford. He was patched by telephone to Commander Bob Cabana, KC5HBV on board the Space Shuttle Columbia via amateur stations WH6CJU in Hawaii, N6IZW in San Diego, CA, and W5GEL in Corpus Christi, TX. Each of the stations are part of a SAREX worldwide telebridge ground station network.
General Stafford is a former astronaut who flew aboard the Gemini 9 and Apollo 10 missions, and commanded the US/Russian Apollo-Soyuz test project. The SAREX exchange of greetings between Stafford and Cabana reflected upon the 25th anniversary of the Apollo 11 mission to the moon.
The contact was managed by Frank Bauer, KA3HDO at the Goddard Space Flight Center in Greenbelt, MD, and by Lou McFadin, W5DID

and Gil Carman, WA5NOM from the SAREX Control Room at the Johnson Space Flight Center in Houston, TX.

(*****
NASA TELEVISION COVERAGE

NASA television coverage is available to all in the continental United States through C-band satellite. NASA Select video is found on Satcom S2. Satcom S2 is located 22,300 miles straight out from Equator at 69 degrees West.

(*****
LUSAT

Controllers report that the LUSAT 1 ham satellite appears healthy after experiencing a software crash. The software load was performed as part of the recovery effort was intentionally stopped after the second module was loaded and turned on. The next step of the recovery will involve continuing with the satellite's deep tests. The satellite is sending telemetry on 437.125 MHz and it's digipeater is turned on.

(*****
MELBOURNE HAMFEST

On the convention circuit, the Melbourne Hamfest is coming up on September 9 - 11 at the Melbourne Auditorium in Florida. Featured will be new equipment displays, swap tables, a flea market, forums, prizes and more. For further details send a self-addressed stamped envelope to "Hamfest Information, Platinum Coast Amateur Radio Society, P. O. Box 1004, Melbourne, FL 32902.

(*****
CAN EX

The Canadian National Exhibition, Canada's largest annual presentation, will open its gates on Friday 19 August, 1994 and run until Labor Day. The gathering is being held at Exhibition Park in Toronto. VE3CNE, Canada's premier display of Amateur Radio will again be in operation at the CNE at the Better Living Centre. QSL cards will be sent to all contacts made.

(*****
DXCC UP

The ARRL reports that business is up in its DXCC Branch. In March, 1127 applications for new awards and endorsements were received, and for the first three months of 1994 applications are up by 18%, QSL's by 48%, over 1993. Turn around time for awards right now is about three and a half weeks.

(*****
DX

In DX, word that YI9CW has been quite active from Iraq. Check 18.074 kHz between 14:00 and 15:00 UTC and QSL as directed. Also, HL9HH slash KJ6YR, is on from South Korea looking for 40 and 80 meter fills for Worked All States. He operates between 10:30 and 12:00 UTC daily. On 40 meters, he operates between 7.002 and 7.009 MHz. On 80 meters, he is on between 3.502 and 3.509 MHz. QSL via PSC 3 Box 3695, APO AP 96266-3695.

NYC NEWSLINE BACK ON

Some good news to report. After several months off the air due to equipment failure, the New York City outgoing Newsline service is back in operation. As reported last week, the equipment failed while Paul Migliorelli, N2ETO who oversees the operation was away from the city. When he returned he found that the unit was beyond repair. It took a number of weeks to locate the type of machine needed. Another several days were spent reworking it to Newsline specifications and more time to ship it to Queens New York. All that has been done and Paul reports that service on the (718) 353-2801 outgoing line was restored last week. So if you were a regular user of the New York City outgoing newsfeed line, be aware that area code (718) 353-2801 is back in service, once again.

(*****

And for this week, that's all from the Amateur Radio Newsline. You can write to us at:

The annual Melbourne Florida HAMFEST, sponsored by the Platinum Coast Amateur Radio Society (PCARS), will take place September 10 and 11, 1994.

Talk-in frequency will be: 146.25/146.85 MHz (input/output).

This was one of Florida's best last year, and hopes to be even better this year! Only two-three miles east from Interstate 95, exit 71.

All TNC's fit your bill pretty well. They all run off a serial port, and
contain a microcomputer to handle most of the overhead. MFJ, Kantronics,
Tiny TNC - all will do what you want.

First thing, if any one is interested in responding, could you do me
a big favor and e-mail it directlyto my address? thanks...
Well, TCP is something I would love to get into, and I've read all
the fact sheets and "beginners" explanations..but its now left me with
some unanswered questions. First, Is the idea behind TCP that a local
server picks up on your radio messages and just keeps relaying them? Do
most areas have these servers to connect to any other place than the apx.
100 mile direct radio VHF radius?
The idea is to to communicate over long distances using a vhf rig,
correct?
Lastly, can TCP addresses be written to from the landline internet? Thanks
in advance for anyone who chooses to reply, your help would be
appreciated. :)

AMSAT-UK COLLOQUIUM REPORT #1

HR AMSAT NEWS SERVICE BULLETIN 225.01 FROM AMSAT HQ
SILVER SPRING, MD AUGUST 13, 1994
TO ALL RADIO AMATEURS BT
BID: $ANS-225.01

AMSAT-UK Colloquium Report: Part 1

AMSAT-UK's annual Colloquium was held at the University of Surrey between 28th to 31st July 1994; over 133 people came from 22 countries in five continents to attend this Colloquium.

The University of Surrey personnel gave several talks about their equipment and the science they are conducting. Noteworthy points about their thinking include: low-cost propulsion (hybrid motors); mini-sats (up to 200 Kg) rather than MICROSATs; higher data rates; use of S-band; GTO, or modified GTO orbits; spread spectrum. One of their approaches to building less expensive satellites was the subject of one paper. It involves the use of commercial grade battery cells. A single space qualified NiCd cell costs about $4000. Surrey buys commercial cells for about $12 each and qualifies them for space use in house, with a resultant cost per cell of less than $1000.

Doug Loughmiller spoke about the S-band beacon on UO-11 which has been switched on for a considerable time; but he has had no reports on it, and appealed for folks to let him know if they hear the beacon, or even if they listened but could not hear it.

Doug also provided an explanation of some of the more obscure codes seen on-screen from UO-22:

F: available space in program memory
L: largest free part of ---''---
TST: transputer status
d: digipeater (0=off)
B: bytes transmitted
Uptime: lifetime of current operations (Days/hours/minutes)
SPIN: 10.1K12G3.2 = 10.1 seconds for one revolution; earth magnetic field model 12; gamma angle (largest offpoint of libration since midnight) 3.2 deg

Ray Soifer W2RS gave a presentation regarding the US Government's intention to "sell" parts of the 2400 MHz band. Concern was expressed by many of the attendees with respect to any such attempt.

James Miller, G3RUH, gave a resume of AO-13's status. He pointed out that, since the proton event of Nay 13th, EDAC counts have been consistently higher than previously. He stressed, however, that AO-13 should continue working up to re-entry. Nevertheless, the effects of drag, once perigee starts to get quite low, are uncertain.

Gerard Auvray, F6FAO, talked about ARSENE which has now been abandoned. He said that the cable between 2M the equipment and antenna was changed just before launch. The suspicion is that a connector was not tightened properly. He also said that there is a new plan, involving a four to five year time-scale, to build a "micro-sat" carrying a Mode l/S linear transponder, this time using the low end of the 2.4 GHz band. A camera may also be incorporated.

A representative from AMSAT-OZ gave a presentation about their replacement for the Kansas City Tracker. The software takes four bits from an IBM PC parallel port and controls the rotors via opto-couplers. It was said that the cost to build is about $20 to $25. The device works on an open loop principle whereby positioning is determined by knowing the time it takes for the rotor to move a specified distance. One can re-calibrate this by moving the rotor to its stop. It was admitted that this approach is not as precise as the Kansas City tracker and similar devices, but it is acceptable for antenna beamwidths greater than
about 20 degrees. The program can also use a tracking table. AMSAT-OZ will be supplying these to AMSAT-UK for international distribution with profits going to AMSAT-UK's Phase-3D fund. AMSAT-UK will make an announce-ment once stocks are to hand.

[The AMSAT News Service would like to thank Richard Limebear (G3RWL) and Ray Soifer (W2RS) for their help in preparing this bulletin item.]

AMSAT-UK COLLOQUIUM REPORT #2

HR AMSAT NEWS SERVICE BULLETIN 225.02 FROM AMSAT HQ
SILVER SPRING, MD AUGUST 13, 1994
TO ALL RADIO AMATEURS BT
BID: $ANS-225.02

AMSAT-UK Colloquium Report: Part 2

Phase-3D papers were presented by Keith Baker KB1SF, Peter Guelzow DB2OS, Karl Meiner DJ4ZC (read by DB2OS), Mike Dorsett G6GEJ and Hans van de Groenendaal ZS5ALE. KB1SF's talk concentrated on the work going on here in the U.S. with emphasis on current progress in getting the spaceframe, now at the Orlando Integration Facility, ready to receive modules. Peter Guelzow's paper dealt with the electronic modules to be included on the satellite, especially the RF equipment.

Future ANS bulletins will carry additional details regarding the Phase 3D subjects presented.

Other Future Spacecraft

Several new satellite projects were announced. One is a non-Amateur spacecraft for the Chilean Air Force called FASAT.

Sias Mostert, ZR1MS, of the University of Stellenbasch, presented a paper on a South African satellite called "SunSat". It measures 45 x 45 x 40 cm and weighs 50 Kg. Current plans call for its launch in January 1996 on a U.S. Air Force Delta mission into eccentric polar orbit measuring 400 by 800 km with a period of 100 minutes. In addition to the usual VHF/UHF (Mode u/v) communications at 1200 and 9600 bps, SunSat is said to have a capability for Mode l/s. The 2401 MHz transmitter is expected to have five watts output and use QPSK modulation and have capability for a 40 Mbps wideband digital downlink intended to transmit video images. It was noted that sufficient bandwidth for experiments such as this is not likely to be available in the 2.4 GHz band if the U.S. NTIA/FCC proposals, currently being discussed, are adopted. The spacecraft will have a conventional power system, reaction-wheel attitude control, and 64 Megabits of RAM for its 80188, 80386 computers and T-800 transputer. The imager payload will consist of a linear array CCD camera producing 8000 pixels in a moving swathe. A resolution of 50 meters per pixel is expected.

AMSAT-UK Colloquium Report, Part 3: International Satellite Issues

The International Satellite Meeting was chaired by G3AAJ and convened at Thursday evening. A consensus was reached regarding the relationship between the international satellite community and the IARU. This was reflected in a resolution, which reads as follows:

INTERNATIONAL SATELLITE MEETING

INTRODUCTION

The International meeting of the AMSAT Groups hosted by AMSAT-UK at the University of Surrey on 28 July, 1994 expressed concern about the manner in which the services of the IARU Satellite Coordinator were terminated.

It was resolved that:

1. The IARU Administrative Council be urged to create the following positions:

- IARU SATELLITE LIAISON OFFICER

- IARU SATELLITE COORDINATOR

2. The Satellite Coordinator be appointed by the IARU Administrative Council on recommendation of the above mentioned International meeting.

3. The Satellite Liaison officer be appointed by the IARU Administrative Council.

4. The IARU Satellite Coordinator reports to the IARU Satellite Liaison Officer and that he shall be re-imbursed reasonable expenses in accordance with established procedures.

5. It is the express task of the IARU Satellite Coordinator to work closely with AMSAT groups as per terms of reference.

6. The meeting recommends that Freddy de Guchteneire ON6UG be appointed to the position of IARU Satellite Coordinator. Such as appointment to be made by the IARU Administrative Council at the September 1994 meeting.

R.J.C. Broadbent, G3AAJ
Chairman of the International Meeting

It was reported on Friday afternoon that ON6UG, who was not present at the meeting, but he had been contacted by telephone and was in agreement with the meeting's recommendation.

It was decided that, if the satellite's owners agree, POSAT should no longer be referred to as OSCAR 28 since it has been withdrawn from amateur use, but that the number 28 shall be reserved in case POSAT is returned to amateur use in the future.

On Sunday afternoon, Ivan, OZ7IS, chairman of the IARU Region 1 VHF Committee, reported on the Committee's "lengthy discussion" concerning SAREX and MIR. The Committee decided to recommend that, if possible, the downlink be moved to 145.80 and a European voice uplink be introduced at 145.20. The problem is mainly one of terrestrial QRM to the downlink due to the heavy use of 145.55 in Europe for FM simplex operation. The recommendation has been conveyed to the SAREX Working Group.

At the end of the Colloquium the award for the best paper went to James Miller G3RUH (AO-13) and second place went to Leonid Labutin UA3CR (SAREX in Moscow).

This having been the ninth and final Colloquium that Ron Broadbent G3AAJ has organized, Ron was thanked by one and all for his superb performance over the years. Next year's Colloquium, to be organized by Doug Loughmiller G0SYX, will be held 26-29 July 1995.

[The AMSAT News Service would like to thank Richard Limebear (G3RWL) and Ray Soifer (W2RS) for their help in preparing this bulletin item.]

WEEKLY OSCAR STATUS REPORTS

HR AMSAT NEWS SERVICE BULLETIN 225.04 FROM AMSAT HQ
SILVER SPRING, MD AUGUST 13, 1994

TO ALL RADIO AMATEURS BT
BID: $ANS-225.04

Weekly OSCAR Status Reports: 13-AUG-94

AO-13: Current Transponder Operating Schedule:
M QST *** AO-13 TRANSPONDER SCHEDULE *** 1994 Jul 11 - Sep 12
Mode-B : MA 0 to MA 90 | Omnis : MA 230 to MA 30
Mode-BS : MA 90 to MA 120 |
Mode-S : MA 120 to MA 122 |<- S beacon only
Mode-S : MA 122 to MA 145 |<- S transponder; B trsp. is OFF
Mode-S : MA 145 to MA 150 |<- S beacon only
Mode-BS : MA 150 to MA 180 | Blon/Blat 180/0
Mode-B : MA 180 to MA 256 | Move to attitude 230/0, Sep 12
==========
N QST *** AO-13 TRANSPONDER SCHEDULE *** 1994 Sep 12 - Dec 19
Mode-B : MA 30 to MA 150 |<- OFF Oct 22 - Nov 07 for eclipses
Mode-B : MA 150 to MA 190 | max duration 2h 12m
Mode-BS : MA 190 to MA 218 |
Mode-S : MA 218 to MA 220 |<- S beacon only
Mode-S : MA 220 to MA 230 |<- S transponder; B trsp. is OFF
Mode-B : MA 230 to MA 30 | Alon/Alat 230/0
Omnis : MA 250 to MA 140 | Move to attitude 180/0, Dec 19
The battery charge state is of paramount importance during the eclipse seasons. As always the command team may have to have to make temporary changes to the published schedule. In that case we will try to minimize the inconvenience, setting Mode-B OFF from MA 230-256 in the first instance.
==========
[G3RUH/DB2OS/VK5AGR]

RS-10: A couple of weeks ago WC9C pointed out that RS-10's 10M downlink signals were sounding quite weak in comparision to a few months about. G3IOR thinks that the problem of weaker distant and stronger distant signals from RS-10 attributed by WC9C to the parent satellites attitude is due more to path attenuation. In the summer we have spread "E" layer levels of far higher intensity. At low angles of incidence, i.e. when the satellite is close to horizon, the path through these attenuating layers is extended, thus producing a much weaker signal, more than can be accounted for by the inverse square rule. When the satellite is close to overhead, the path is minimal, and also far less refraction, reflection and absortion results. RS-10 antenna is close to omni-directional, with only the odd end-on tip effect momentarily reducing the downlink level during it's slow rotation. At night, when the ionization is markedly reduced, signals are nominal. [G3IOR @ GB7VLS]

AO-16: AO-16 is going strong with no problems. [WH6I]

LO-19: LO-19 still seems have its BBS turned off. [WH6I]

IO-27: WH6I still has not heard anything from IO-26 and is afraid that it might stay that way permanently. [WH6I]

AO-16: Still going strong and very doing well. There is some gateway traffic on AO-16 but not enough to present any problem to other users and the file lifetime on the bird is still quite long. [WH6I]

KO-23: Since yesterday KO-23 seems to be down. Yesterday the 9600 baud signal sounded normal, but there was no data on it. Today the signal sounds abnormal. N4NR also reports that KO-23 is in a mode that leaves TNCs and DSPs locked up until a cold reset at the groundstation after the pass is over. Signal strength is good, however. [WH6I & N4NR]

The AMSAT NEWS Service (ANS) is looking for volunteers to contribute weekly OSCAR status reports. If you have a favorite OSCAR which you work on a regular basis and would like to contribute to this bulletin, please send your observations to WD0HHU at his CompuServe address of 70524,2272, on INTERNET at wd0hhu@amsat.org, or to his local packet BBS in the Denver, CO area, WD0HHU @ N0QCU. Also, if you find that the current set of orbital elements are not generating the correct AOS/LOS times at your QTH, PLEASE INCLUDE THAT INFORMATION AS WELL. The information you provide will be of value to all OSCAR enthusiasts.

Source record: 261671

Hi,

I just bought a Yaesu FT11-R HT...I really like it so far - the only problem I have with it is that if I use it near my computer [when it's turned on] it gives off really bad interference. Is that normal? and if not, what can I do about it...I'm not sure that I'm even using the right terms...I'm so new to all of this...

Thanx in advance

Hello all, but especially those in the USA...

My wife and I are in the early stages of planning a holiday in the USA, and would be grateful for any hints or tips you can give me to get a bit of Amateur Radio into the trip.

Here's the background:

- About three weeks in total, starting around 3 or 4 February next year, ending around 22 or 23 February;

- Phyllis insists that we spend a few days at either Disney World or Disney Land, as she has been wanting to go there since childhood. (Neglect of this condition could destroy the marriage :-) Disney Land is favourite at the moment, as she also wants to see California; but Florida is not totally ruled out yet.

- Other than that, the plan is to drive round, seeing the sites and generally having a good time. We have lots of suggestions of places to go and see, but the schedule is pretty open so far. Mostly we will be staying at low latitudes, for the weather.

My questions are:

1. I understand that my full UK call will let me operate in the USA. Can anyone point me at somewhere to get more info on reciprocal licencing?

2. (More important) While the schedule is still open, are there any Amateur Radio related events happening in early February that could conceivably be worked in to the trip? A big rally? Or even a small one?

3. I'm not planning any HF operation - probably just a 2m handheld to say "hello" while I'm there. I've never operated in the USA, and never heard any of your repeaters - and I won't have much time to learn how you do things differently to the UK. What operating tips do you have - or what do you recommend I read?

We are only just starting to think about the plans, so any hints, tips or suggestions would be really helpful.

(ducking for cover) Please e-mail replies ... I *do* read this group regularly, but I think the number of people interested in exactly the same questions is likely to be small, and I wouldn't like to see a lot of bandwidth wasted. If you think I'm wrong in that, post away, and I'll be just as grateful!

73, John, GM4ANB

Well, in a way, you could say that the interference is "expected."
Unless you happen to have a wonderful monitor RFI filtered up the wazoo,
you will get even a little, sometimes almost unnoticable interference. In
the case of our "video" club, (we go around and tape basketball games for
the school district), since not all of us have licenses we use 5w handheld
CB's. If you use those near TV equipment, there is CONSIDERABLE video
interference. (BAD glitches on tapes!!) You might find help in any of the
RFI books published by the ARRL. 73's!

___Joe

ps...the radio you are using is really a nice piece of equipment...

>Is there a telnet site, or a text file that has the entire contents of
>the ARRL repeater directory?

As a public service to the amateur community, I and several people on the net tried to create an online repeater directory. This online directory used the ARRL directory as one of the sources. The ARRL sent me a letter "recommending" that I refrain from using their directory. The last version of the my online repeater directory which contained ARRL data is 0.03. Perhaps you can find that lying around somewhere on the net. The current "Universal and Free Listing of Repeaters for Radio Amateurs" is (as far as I know) freely redistributable. The current version is 0.10. Version 0.11 should be out RSN. I have just added some Netherlands data and gotten a California update. I am currently working on some 10 Meter data. Additional entries, of course, are welcomed.

Sorry about previous post (I'm still learning how to run this thing).

I'm going to be in the Washington, D.C. area and am wondering if there are any 220 repeaters permanently linked to 2m.

Any other 220 and 2m repeater information would also be appreciated.

Thanks in advance, John.

Editor Tedd Mirgliotta, KB8NW
Provided by BARF-80 BBS Cleveland, Ohio
Online at 216-237-8208 14400/9600/2400/1200/300 8/N/1

Thanks to the Northern Ohio Amateur Radio Society, Northern Ohio DX Association, Ohio/Penn PacketCluster Network, DF4RD, DL7VEE & DX NEWS Letter, KD1F, K4CEF & Southeastern Cluster Group, W4DW, SM0CNS & SM0TXT of the DX-Loggen and VP2ML & The DX Bulletin for the following DX information.

3A, MONACO AND 4U1ITU. Luciano, I1YRL, plans to be active from 3A and 4U1ITU from mid August until November. There are no other details available at this time,other than he works mostly CW. ADDED NOTE: Also W5ZPA has announced he will become active from Monaco starting August 16.

3D2, FIJI ISLANDS. I4ALU is on the air from Fiji using 3D2CA from August 10-23. He will also be active from two different IOTA's. By the time you read this, he will have finished his activity from Vitu-Levu Island (OC-016) from August 10-14th. I4ALU will then be active from August 15-23th from Torkoriki Island (OC-121). After that he will go to KH6, August 24-26th. QSL via I4ALU.

3D2, ROTUMA. Ruvendra, 3D2RP, was heard active on 20 meters SSB this past weekend on 14211 kHz at 0345z.

3D2 CONWAY REEF. There was a report (but this has not yet been confirmed) that Raj, 3D2ER, was reportedly active from here the past several days on or around 14028 kHz between 0330 and 0430z.

3V, TUNISIA. The DXNL reports that Ron, AA5DX, will be in Tunisia around mid August. No details on how long he will be there or if he is going to try to operate. KYFC!!

5R, MADAGASCAR. Karl, 5R8KH, was heard this past weekend on 21295 kHz around 1700z. QSL via WB8LFO.

9X, RWANDA. VE3MJQ will be in Kigali for six months starting on August 15th. He expects to receive a callsign and will operate mostly on SSB. QSL via VE2PR. Also, a reminder that Alex, PA3DZN, will go to Kigali on an order from the UN and hopes to be active as soon as possible.

A5, BHUTAN. Jim Smith, VK9NS, was heard earlier in the week on the air discussing the possibility of returning to A5-land. Jim has been working with the Ministry of Communications for quite sometime now in hopes to return and activate this most wanted country. Jim was heard mentioning that once he gets the word to operate, he can be in A5-land in 48 hours because all the equipemnt is already there.

IOTA ISLANDS. By the time you read this Martin, G3ZAY/NU2L, and Tom, WT2O, will be done activating a new IOTA from Hopewell Islands (now NA-195) in the Hudson Bay Quebec Coast North Group during August 13-14th. They will also be active from Belcher Islands (NEW IOTA) from August 15-18th. There may be a short visit (few hours) to King George Islands (IOTA NA-159) on the 16th or 17th. QSL WT2O/VE8 via WT2O and NU2L/VE8 via G3ZAY.

OS, BELGIUM. The DXNL reports that a special prefix of OS may be used by Belgium stations from September 1 until December 31, 1994. No details were given why. OPDX will try to find out.

S61, SINGAPORE. Some stations in 9V1-land will be using S61 prefix now until September 12th to commemorate the 25th anniversary of the Singapore Amateur Radio League.

TA, TURKEY. Bob, TA1/K4UEE, has been active for several days, emphasizing CW on 40 and 20 meters with some 20 meter SSB. He put out the word on August 10th that he would be active on 160 meters at 0100, 0200, and 0300z on 1827 khz listening up the band. No further information was given as to his length of stay in Turkey and if he may try again.

TU, IVORY COAST (also 9L and EL). Jay K4ZLE, will be active from TU-land, August 18-20th and again August 26-30th. He has requested a callsign, but nothing as been used as of yet. Activity will be mostly on CW all bands 80-10 meters. From August 20-23th, Jay will be active in Sierra Leone and from August 23-26th, he will be in Liberia as EL2LE. QSL to CBA.

NO OPDX BULLETIN NEXT WEEK (AUGUST 22th)! But please keep sending your information to the following addresses below..... TNX de Tedd KB8NW

FAX YOUR DX INFORMATION NOW! Faxing is available Monday/Wednesday/Friday from 0430 to 2330z only. The number is 216-237-8208 and the FAX card is sharing the same phone line as BARF-80 BBS using a data/fax/phone switch.

Excerpts and distribution of The OPDX Bulletin are granted as long as KB8NW/OPDX/BARF80 receive credit. To contribute DX info, call BARF-80 BBS online at 216-237-8208 14400/9600/2400/1200/300 and leave a message with the Sysop or send InterNet Mail to: aq474@cleveland.freenet.edu or send BitNet Mail to: aq474%cleveland.freenet@cunyvm or send PRODIGY Mail to: DFJH48A or send a message via packet to KB8NW @ WA8BXN.OH.USA.NA

Telephone GEC Plessey semiconductors on (408) 438 2900 and ask them about availability of the GP1010 and GP1020 ICs and GP1010 evaluation board. The GP1010 is a receiver on a chip (just add clock and sprinkle lightly with passives) the GP1020 is a correlator that decodes the spread spectrum signal. You will need to design and build your own interface to your development PC of whatever though.

As for information about signal structure etcetera, go to your library and look for anything by J.J.Spilker, issues of GPS world and (unlikely in the US) copies or Electronics World (UK publication) for about 18 months ago. If you can get the annual report from the Institute of Navigation (ION) so much the better. An excellent introduction to GPSs. As for GPS resources, well, there is a GPS UseNet group (can't recall off hand exactly what), but that is mainly uses of GPS and reviews/opinions of particular devices.

Mike.

AD> mentality in this country these days...

AD> Andy N3LCW

As someone who has made my living in the automobile business, it still amazes me that there are dealers still around like the one you delt with. A dealer CAN NOT declare that a certain new car that they sell and service under their franchise agreement has no warranty on it. If the car is new and has not been titled <still under MSO>, the manufacturer and ONLY the manufacturer has the right to deny warranty coverage on that vehicle. A dealer is under obligation to repair defects caused by factory mistakes in assembly, or nonfunctioning componets, or depending on the make of car<or the state you live in> you have, they are also responsible to correct without charge anything that may be out of adjustment. A dealer can <and this is treading on thin ice> deny warranty coverage to any vehicle that in the dealers mind, has be abused, used in taxi service<taxi's have a different warranty coverage> or not maintained within the guidelines prescribed by that manufacturer. The fact that you have installed radio gear in your vehicle is not in itself evidence of any of the above reasons to deny coverage. Now should the dealer find that the wiring you may have installed caused RF interference to an electrical componet that then failed because of said RF getting in, you may very well be denied coverage. But for the dealer to state that they are denying coverage based on nothing more than a quick glance at the radios or antennas is opening up a hole in their legal defense account big enough to drive a bus load of lawyers through.

If you still have a copy of that retail buyers order with the denial of warranty coverage on it, I would send a copy to your State's Consumer Affairs Department, also the the State's Attorney General's Office. Along with this I would send copies of the order, and letters to the Manufacturers Consumer Office<located in the back of the Warranty Book>. This will help to open up that dealers eyes.

Now if your looking for warranty coverage of a broken steering wheel because you bent it in anger because you missed that last station to get your DXCC mobile contact, you also may be out of luck. <G>

Greater than 2 MeV Electron Fluence for 14 AUG is: 4.0E+08

SYNOPSIS OF ACTIVITY

Solar activity was moderate during the past 24 hours.
Region 7765 (S10W10) produced an M3.9/1N flare maxing at
14/1738. The flare was accompanied by radio bursts including
210 flux units at 2695 MHz (a tenflare of 7 minutes duration)
and 170 flux units at 245 MHz. Six other C-class x-rays events
were observed from 7765 during this reporting period. 7765 is
now extremely magnetically complex (beta gamma delta) and has
doubled in white light since yesterday. New Region 7766
(N10E47) emerged on the disk as a small C-type group. Surging

was reported on the west limb near N06, the location of departing Region 7762.

Solar activity forecast: solar activity is expected to be low. However, Region 7765 is capable of additional moderate (M-class) x-ray flares.

The geomagnetic field has been mostly active with some periods at minor storm levels. The source of this disturbance is unknown. High fluxes of energetic electrons have been measured at geosynchronous satellite altitudes.

Geophysical activity forecast: the geomagnetic field is expected to persist at active levels tomorrow, declining toward unsettled conditions on the 16th. A coronal mass ejection potentially associated with today's M3 tenflare could arrive late on the 16th or early on the 17th, resulting in resumed active geomagnetic conditions by the end of the forecast period.

Event probabilities 15 aug-17 aug

Class M 40/40/40
Class X 05/05/05
Proton 01/01/01
PCAF Green

Geomagnetic activity probabilities 15 aug-17 aug

A. Middle Latitudes
Active 40/35/45
Minor Storm 05/05/20
Major-Severe Storm 01/01/10

B. High Latitudes
Active 50/40/50
Minor Storm 30/15/30
Major-Severe Storm 01/01/10

HF propagation conditions were below-normal over several regions today. The high and polar latitude paths experienced below-normal propagation attributed to geomagnetic storming. Some equatorial regions also experienced below-normal propagation. In addition, today's M3/1N tenflare produced a moderate-intensity short wave fadeout (SWF) that should have affected most of North and South America beginning near 17:38 UTC. Propagation conditions are expected to improve over the next 24 to 48 hours. There is a chance today's M-class flare may have been associated with a coronal mass ejection capable of affecting the Earth late on 16 August or early on 17 August. If so, middle to polar latitude propagation may become degraded on 17 and 18 August if this disturbance materializes. There remains a fairly good chance for

additional M-class flares capable of producing SWFs. There is also a remote possibility of a proton flare capable of more seriously degrading polar and high-latitude paths due to enhanced PCA before Region 7765 rotates behind the west limb on 20 and 21 August. Communicators using the high latitude circuits should therefore be aware of the small but increased threat for possible PCA-related signal absorption during this time period. Users of polar-path navigation beacons should likewise be aware of the slightly increased chance for errors should such degraded conditions materialize over the next week.

NOTES:
All times are in Universal Time (UT). Characters preceding begin, max,
and end times are defined as: B = Before, U = Uncertain, A = After.
All times associated with x-ray flares (ex. flares which produce
associated x-ray bursts) refer to the begin, max, and end times of the
x-rays. Flares which are not associated with x-ray signatures use the
optical observations to determine the begin, max, and end times.

Acronyms used to identify sweeps and optical phenomena include:

II = Type II Sweep Frequency Event
III = Type III Sweep
IV = Type IV Sweep
V = Type V Sweep
Continuum = Continuum Radio Event
Loop = Loop Prominence System,
Spray = Limb Spray,
Surge = Bright Limb Surge,
EPL = Eruptive Prominence on the Limb.

Listen for Mir and the space shuttle on 145.55 (mostly 1200baud packet)
as well as AO-21 on 145.987 and DO-17 (Dove) on 145.825.

You might be able to catch them on a "duckie" but as always with antennas,
more is better.

I just wanted to tell everyone that on Saturday I passed my tests for a Technician No-Code license. Now comes the waiting. How long is the average wait time now? I heard 17 weeks and 13 weeks. Anyone hear any more optimistic times? :)

Mike, No callsign yet, but 2 days and waiting. :) :)

2592. Slow Code idea by Wayne

Newsgroup: rec.radio.amateur.misc
Date: 1994-08-15 07:44:45 UTC
From: lenwink@indirect.com
Message-ID: <lenwink.174.0007BF27@indirect.com>
Source record: 261696

Wayne Green, publisher of 73 Magazine, said on the Ham Radio & More show, 8/14/94, that we should have only 1 class of amateur license. It should require 5 wpm code knowledge and more theory than is tested now. It would allow full priviledges on all bands. Wayne also said he wants to see programs started in schools. Every school should have a ham club and actually teach electronics and amateur radio. This will most definitely advance the hobby and technology.

2594. Help identify FSK signal on 144.978 MHz please

Newsgroup: rec.radio.amateur.misc
Date: 1994-08-15 07:53:32 UTC
From: pbell@axion.bt.co.uk
Message-ID: <1994Aug15.065332.27405@lssec.bt.co.uk>
Source record: 261688

Can anyone help me identify a signal please. During a meteor watch on 144.975 MHz I picked up two long bursts of an FSK morse signal between 19:39 UT and 19:42 UT Friday 12 August. It was 2 to 3 KHz high of my listening frequency. The signal consisted of 5 character groups of what appeared to be random letters. The data rate is quite high, much higher than normal practice transmissions.

I have checked my frequency calibration and that appears to be ok.

The signal was certainly FSK. At first I was puzzled because only the lower tone was easily audible. By playing with the tapes I was able to make the upper tone audible and hence render the signal readable.

The signal strength was quite good. Good enough in fact for my computer to detect it's presence and indicate it on a print out.

Allan Bell G6AXO

Replies please to pbell@lssec.bt.co.uk

>
>Just for the sake of discussion, how is this vastly different from
>calling someone on an autopatch?
>
First note that the language of 97.111 actually speaks of "amateur
stations", not "amateurs". The way it's been explained to me is that
this is considered a communication between the amateur station
autopatching and the repeater, controlled by the control op, who is
allowing third party traffic over "his" station via the autopatch. I've
heard that some repeaters turn off their autopatch late at night when
all the control ops are in bed to stick more closely to the letter of
the law (and to prevent mischief in general).

I'm sure others will have more to add to my answer.

Mike, KK6GM

It was named for a Mr. Beverage (nothing to do with something to drink).
Unfortunately I don't have any biographical details on him.

PRESIDENT'S ADDRESS

This is Michael Corbin VK2PFQ.

As you know by know, this weekend is R.D. Contest Weekend. This contest is held annually on the weekend nearest to 15th August, the date on which hostilities ceased in the South West Pacific Area.

As a mark of respect for our fallen amateur radio comrades, I do not propose to discuss the latest goings on in this Division.

Instead I would encourage all amateurs, particularly those who have not considered it yet, to participate in this contest. If you're not sure of the Rules, consult Page 33 of July A.R. If you're not a member borrow a copy.

There is however one bit of local news I must give you and that is .. .. This week on Friday the 19th August, there will be a meeting of the "Council" of the W.I.A. N.S.W. Division, timed to start at 7.30 p.m.. As this meeting is an important one, where discussions will take place concerning our legal advice, I directed the Secretary last Monday 9th August to advise all Councillors that this would be an "open meeting" I again stress....This is a very important meeting with far reaching consequences. I believe that members should be given the opportunity to hear for themselves, the arguments put forward by Councillors for and against, the proposal that "This meeting instruct the Divisional Barrister to proceed as per the advice received from Messrs. Lewarne and Goldsmith of Parramatta."

I have formulated this motion only as a basis for discussion, not as an attempt to dictate to members. Councillors have been made aware of the importance of their attendance at this meeting. Further, I have also directed the Secretary to seek opinions on this matter, in writing, from anyone who is unable to attend.

All MEMBERS, members being the operative word, are invited to attend. Non-Members are not welcome on this occasion. I request, in advance, that anyone attending should come to listen rather than to participate. You'll get that opportunity at the next election!

Good luck in the Contest....

See you next week.

6 Metre repeater on air

The 6m repeater has finally been commissioned. The output of the repeater is 53.850 MHz, with a 1 MHz negative input -- i.e. 52.850 MHz input and 53.850 MHz output.

The unit is a modified 828E Phillips transceiver. There are three cavity filters in use, one on the repeater's transmit frequency, one on the repeater's receive frequency, and one on the 6m beacon. Thanks go to Tony Liolio VK2ZLT, Dale Woodside VK2TZ, David Horsfall VK2KFU, Colin Mackinnon VK2DYM, John Telek VK2XTB, Steven Kuhl VK2TQ and Ray Hardimon VK2ZZK for turning a dream into a reality. i would also like to give a special thanks to Michael Corbin our NSW WIA President for permission to install the unit at Dural.

The repeater unit was turned on at 5,45 pm this afternoon. At about 7.30 pm the power was turned off to the unit as per instructions while the broadcast takes place. All going well power will be restored at the conclusion of the broadcast.

(submitted by Tony Liolio VK2ZLT)

WICEN News

This is a reminder that the Sydney WICEN repeater on channels 150/8275 is now back on air following extended repairs and maintenance; signal reports would be appreciated.

There are no new events on the WICEN calendar in the immediate future, so in the meantime here are the events this month. Hunter WICEN meet on Monday, and Pauline VK2GTB will make you welcome; and Sydney South will have their AGM on Tuesday, with Kevin VK2CKD in the hot-seat. Those members who are also involved with other emergency services may be interested in the "Rescue Expo" at Darling Harbour next Sunday, 21st August. This is followed by the Windsor-Sackville Regatta on Saturday 27th August, from 0730 to 1330. Contact details are scanty at the moment, but interested personnel may contact John Buxton VK2GJB. Also, don't forget that contributions to the newsletter close on 30th August.

WICEN is always looking for members to provide the community with communications assistance. Write to WICEN (NSW) Inc, PO Box 123, St Leonards 2065 for further information, or come up on one of the WICEN nets: Blue Mountains on the first Monday of each month at 8.30pm on channel 7175 simplex, Hunter each Wednesday at 7.30pm on channel 6900, Northern Rivers each Wednesday at 8pm around 3610 kHz, Central Coast each Thursday at 8.30pm on channel 7125, and Sydney each Thursday at 9.30pm on channels 7150/8275. If there are any other regular nets then we'd like to hear about them.

WICEN (NSW) Inc. operates a telephone BBS, and it is accessible at speeds from 300 to 14,400 bps on (02) 888-2763. Brett VK2XMU is the "Sysop", and all listeners are invited to use it. A lot of programs, such as "virus scanners" and "PGP", are available for downloading.

-- Dave VK2KFU, WICEN (NSW) Inc. Publicity Officer

Radio to Rwanda

High-frequency radios built by Adelaide manufacturer Codan are being shipped to Rwanda to help in the World Food Programme's massive distribution task.

Staff at the South Australian plant have worked overtime without charge to complete the radios, after Codan took an urgent order from the Australian International Development Assistance Bureau for 18 of its systems.

The managing director, Mr. Michael Heard said the request was just one of many Codan had received in recent weeks from international aid agencies operating in the African nation. This amounted to some $2 million worth of equipment to date.

Mr. Heard said the radios were considered ideal for Rwandan conditions. "They were developed originally to withstand the rigours of the Australian outback and are among the most advanced of their kind in the world," he said.

They were now providing a vital communications link for aid operators struggling to co-ordinate the Rwandan aid effort.

The owners have donated 10 systems, worth about $50,000, and staff have given up their time free to get the radios into Africa. "Everyone is involved, from production right through to management," Mr. Heard said.

From the Australian Financial Review 8th August 1994, submitted by Brad VK2KQH.

SUMMARY OF ACTIVITY

Solar activity was very low all week.

The geomagnetic field at Learmonth (WA) was quiet or mostly quiet until 10th August when the field became unsettled to active, returning to unsettled on 11th.

Ionospheric F2 critical frequencies at Sydney to the 9th were near predicted monthly values with enhancements of up to 50 per

cent late in the UT day. On 10th-11th, frequencies were about 10 per cent above predicted monthly values, with enhancements of up to 50 per cent during local night on 11th. Spread F was observed 0800-1500 UT on 11th.

FORECAST FOR THE NEXT WEEK (12 - 18 August)

SOLAR: Very low.

GEOMAGNETIC: Unsettled 12-13 August then quiet to unsettled conditions.

IONOSPHERIC: Near to 10 per cent above predicted monthly values for August.

Courtesy of IPS Radio and Space Services, Sydney

Summary by Pat VK2JPA ANARTS Broadcast Officer

Waverley Amateur Radio Society

Anyone wishing to be able to design and make professional quality printed circuit boards, should attend the next meeting of the Waverley Amateur Radio Society where Bob Barnes will demonstrate the Protel circuit design software, copies of which will be available to those attending who bring a diskette.

A follow-up session, covering actual board production will be arranged for a later date.

If you want to get into packet radio without spending too much money, you should build the Society's low cost Baycom modem, for which instructions and key components will be available at the meeting.

All those interested will be made wlcome at the meeting which is to be held on Wednesday 17th August starting at 7.00 pm. The venue is Waverley Council's new multi-purpose centre located close to the railway station at

31 Spring Street, Bondi Junction,

Simon Buxton - VK2EII - Publicity Officer

VHF-UHF DX Group

The next VHF-UHF DX Group meeting will be held on Tuesday 20 September at Amateur Radio House. This meeting will be an equipment workshop on the construction of high power linear amplifiers and low noise preamplifliers.

Working examples of linears and preamplifliers will be exhibited to demonstrate how practical construction problems are solved.

The Group also sponsors activity nights on 144 MHz on Tuesdays and 70 centimetres on Thursdays. Things usually get underway after 8 pm.

Why not check into the Group's Sunday evening net on 146.5 MHz FM for details of Group activities. The Sunday evening net starts at 8:15 pm.

Submitted on behalf of Richard Sourlie VK2ARS

FROM THE ST GEORGE AMATEUR RADIO SOCIETY

Members and other interested amateurs are advised that on Saturday the 17th of September the society will be holding its annual Bill Shakespeare Auction.

The auction will be held at the normal meeting venue, that is in the 1st. Allawah Scout Hall corner of Bellevue Pde and Blakesley Rd, South Hurstville.

Equipment for the auction will be accepted between 10 and 11am.

Viewing of equipment between 11 and 12noon.

Auction to start at 12noon sharp.

Credit card facilities are expected to be available for those requiring this facility and the snack bar will be open during the course of the auction.

Inquiries regarding any specific details are welcome, please phone Publicity Officer, ALLAN VK2XF at home on 533-1006.

de Allan VK2XF, Publicity Officer.

Central Coast Amateur Radio Club

The Central Coast Amateur Radio Club will be holding a Flea Market at its club rooms on Saturday 20th August. As a result, the usual mid-month Friday lecture night will not be held in August.

The Flea Market will commence at 1.00 p.m. and a number of trading tables are available in the Club Rooms. Vendors can also trade from their boots, tailgates or trailers in the carpark.

No fees will be charged to traders and free of charge tea, coffee and biscuits will be available during the afternoon.

Bargains abound, so come along to the Central Coast Amateur Radio Club Flea Market, commencing at 1.00 p.m. on Saturday 20th August at the CCARC Club Rooms in Dandaloo Street, Kariong, and help recycle some of the trash and treasure from the 1994 Gosford/wyong Field Day.

From Bob Fitzgerald, VK2XRF, CCARC Publicity Officer

W.A. Packet User and Digipeater List, compiled by Phil VK6KS

Latest update 1/8/94

We have been forwarded the latest update of the above listing which contains 163 stations (if I can count properly!) and their status, e.g. TNC, Digicom, Baycom, digipeater, Rose switch, NETROM node, BBS and type of software, to name a few codings -- also the usual frequency used by the station, including HF frequencies where applicable.

This is a very comprehensive listing and we would be happy to provide a copy for any interested party, on receipt of a S.A.S.E.. It is about 4 (four) A4 pages - just the thing to see if that callsign you want to send a message to is on packet, so that you don't have to battle poor propagation at this time of the cycle.

SARTG WW RTTY Contest 20-21 August

Starts : 3 contest periods: 0000-0800 UTC Saturday, 1600-2400 UTC Saturday, and 0800-1600 UTC Sunday.

Bands: 80, 40, 20, 15 and 1o M.

Classes : a) Single operator, all bands
b) Single operator, single band
c) Mulyi-operator, single transmitter, all bands
d) SWLs, all bands
Note: Single operator, all bands stations may also enter as

a single band entry of their own choice also.

Modes: RTTY only

Exchange: RST + QSO number, starting with 001.

Multipliers: Each DXCC country on each band, including firs
contact with Australia, Canada, Japan and USA. Aditionally,
each call area in VK, VE, JA and W will count as one
multiplier on each band.

QSO Points: QSO with own country, 5 points. QSO with other
countries in own continent, 10 points. QSO with other
continents, 15 points. In VK, VE, JA and W, each call area
will count as a separate country.

Scoring: Sum of QSO points x sum of multipliers = total score

Awards: To the top station in each class, country and
district, if the number of QSOs is reasonable.

Logs: Use separate logsheets for each band. Logs must show :
Band, Date/Timwe (UTC), callsign, wxchange message sent and
received, multipliers and QSO points. Summary sheet must show
scoring, class, your callsign, and name and address. Multi-op
stations must show the callsigns and names of all operators
involved. Your comments will be very much appreciated.

Silent key

We have been notified of the sudden passing of Keith Echberg
VK6KD on 29th July at his home. Keith was a longtime member of
the W.A. Radio Old Timers Club, and originally held the
callsign VK6KE. He worked for many years in Victoria and held
a VK3 callsign, but returned to W.A. on retirement.

SUMMARY OF ACTIVITY

Solar activity was very low all week.

The geomagnetic field at Learmonth (WA) was quiet or mostly quiet until 10th August when the field became unsettled to active, re-turning to unsettled on 11th.

Ionospheric F2 critical frequencies at Sydney to the 9th were near predicted monthly values with enhancements of up to 50 per cent late in the UT day. On 10th-11th, frequencies were about 10 per cent above predicted monthly values, with enhancements of up to 50 per cent during local night on 11th. Spread F was observed 0800-1500 UT on 11th.

FORECAST FOR THE NEXT WEEK (12 - 18 August)

SOLAR: Very low.

GEOMAGNETIC: Unsettled 12-13 August then quiet to unsettled conditions.

IONOSPHERIC: Near to 10 per cent above predicted monthly values for August.

ARLD046 DX NEWS

TO ALL RADIO AMATEURS

THE ITEMS IN THIS WEEK'S BULLETIN ARE COURTESY OF BOB, W5KNE, QRZ DX, AND THE CONTEST CORRAL COLUMN FROM THE PAGES OF QST. THANKS.

YEMEN. BOB, N4GCK, HOPES TO OPERATE FROM A EUROPEAN EMBASSY IN ADEN SOMETIME THIS MONTH. PLANS HAVE BEEN SHIFTED DUE IN LARGE PART TO THE CONTINUING CIVIL WAR IN THE COUNTRY.

CAMBODIA. SANJI, XU7VK, IS ACTIVE, HOWEVER HE WILL RETURN TO HUNGARY SOMETIME EARLY THIS MONTH. HE HAS BEEN HEARD ON 80 METERS BETWEEN 3500 AND 3510 KHZ. ALSO CHECK 14220 KHZ FROM 1000 TO 1200Z. WORD HAS IT THAT VS6WV WILL BE IN XU-LAND IN LATE AUGUST, BUT HIS OPERATING TIME WILL BE LIMITED.

RWANDA. PAUL, F6EXV, AKA 9X5DX, WILL SOON RETURN TO RWANDA TO CONTINUE PROVIDING HUMANITARIAN NEEDS. BECAUSE OF HIS EXPECTED WORK SCHEDULE, AMATEUR RADIO ACTIVITY WILL BE LIMITED AT BEST. HIS QSL MANAGER REMAINS F2VX. ALEX, PA3DZN, IS ALSO ON THE WAY TO RWANDA.

MARSHALL ISLANDS. KEN, V73C, HAS BEEN ON 30 METER CW AND SSB BETWEEN 2000 AND 0400Z. ALSO CHECK 18146 KHZ AROUND 0230Z. QSL VIA OKDXA, PO BOX 88, WELLSTON, OK 74881.

SUBSCRIPTIONS.

Members are reminded that ANARTS Financial Year commenced on 1st July 1994 and that subscriptions are now due. We have had a freebie for 12 months as a gesture to our members but it could not continue that way for ever.

So please send $10 (you know, the pretty blue note) to our Secretary who will process it under our new system which should prevent delays and transit problems.

Send to the official ANARTS address at Box 860, CROWS NEST. NSW. please.

Society information

The Society may be contacted at : PO Box 860, Crows Nest 2065 Australia, for such matters as membership and general enquiries. Enquiries can also be made by packet to the President (Col) VK2CTD, or the Secretary (Pat) VK2JPA at VK2RWI.

News items may be sent to Broadcast Officer PO Box 60 Blacktown 2148 Australia, or by packet to VK2JPA at VK2RWI. Email addresses for the Broadcast Officer are :

patl(at)pitt.conmusic.su.oz.au

The Society welcomes news items on any digital subjects from anywhere in the broadcast coverage area. We know we reach New Zealand and many South Pacific islands, and we were reaching as far north as Japan when conditions were right. We are looking forward to news from your areas to let other amateurs know what you are doing in the hobby. Hope to hear from you.

73s de Pat VK2JPA Broadcast Officer
That concludes the broadcast for this morning/evening.

Sounds like you want them to actually _copy code_! Multiple-guess exams
are _so_ much easier when the content is predictable. Of course there was
the VE in our area who gave a nice true-false exam...questions like, "True
or False: there were eleven commas in the text."

I may have mentioned it before, but we stopped giving a multiple-choice
exam and went to fill-in-the-blanks when an examinee answered 8 questions
correctly with essentially _no_ copy (and even _he_ said he wasn't copying
in his head).

Team championship planned

Amateurs in the Washington, DC area have announced an ambitious plan to sponsor a second World Radiosport Team Championship in July, 1995. It would be patterned after the WRTC held in Seattle in 1990 in conjunction with the 1990 Goodwill Games. This time, instead of being a ''stand-alone'' radio event, ''WRTC 95'' would be held within the IARU HF World Championship contest held annually in July.

The Potomac Valley Radio Club (PVRC) will lead the organization of WRTC-95, and expects many other clubs and individuals in the Washington-Baltimore area to help. The PVRC is dedicating the event to Len Chertok W3GRF, who died in 1994 after a distinguished career as a contester as well as an Elmer.

As in 1990, the competitors will be two-person teams. This time, both members of a team must live in the same ITU zone. The administrators will accept applications from interested competitors, both individuals and teams, until December 31, 1994. The administrators will then evaluate the applications and name a team for each ITU zone from which an application has been received.

In the same manner as WRTC 90, local amateurs will open their stations to the teams; some 50 in the Washington area are anticipated to be needed. Selected teams and alternate operators will be notified by the Administration in the spring of 1995. The organizers also hope to be able to accommodate alternate teams and additional zone teams in some manner.

Each team will enter the multi-single mixed mode class of the IARU contest and will follow all contest rules. The stations will be chosen to have similar equipment and antennas, as in Seattle. This time, a PacketCluster connection will be available at each WRTC QTH

for full use, and computer logging will be required. Also as in Seattle, teams will be assigned stations at random, after their arrival in the DC area, and call signs will be assigned shortly before the 24-hour contest begins.

Co-chairmen for WRTC 95 are Eric L. Scace K3NA, and Howard Leake W6AXX (/3). The administrative office is in care of Hayman Systems, 14700 Sweitzer Lane, Laurel, MD 20707-5905 (fax: 301-470-1580).

Report on reallocation

ARRL's effort to protect Amateur frequencies in the 13 cm band from reallocation is a step closer to success with the release this week of a report from the FCC to the Commerce Department that strongly supports continued Amateur Radio presence in the band. The report disagrees with NTIA's preliminary recommendations that large portions of the band be reallocated for other uses.

The frequencies that NTIA had identified for possible reallocation consist of 2300-2310 MHz, 2390-2400 MHz and 2402- 2417 MHz, which have been shared by Amateur Radio on a secondary basis with Government services. When the process is completed, FCC will administer the reallocation of frequencies identified by NTIA.

While the FCC report praised NTIA for its efforts, it stated that the NTIA proposals require modification. FCC cited concerns in the Amateur community that reallocation would disrupt Amateur operations in the band, and that NTIA failed to meet the statutory requirement that it attempt to determine the extent to which the band could be shared with the Amateur service. The report noted that ''the largest factor affecting the future use of these bands is their existing availability for use by the Amateur service.''

''While we're not out of the woods on this one yet,'' says ARRL President George Wilson, ''it is beginning to look like the comments filed by knowledgeable West Coast hams combined with the League's Washington effort may well succeed in carving out territory for continued Amateur development in the microwave bands.''

An HT has some advantages as a first radio. It can be very cheap and very flexible. You can use it in your car with an external antenna, you can use it at home with an external antenna (like a simple twin-lead J-pole), you can use it for packet, and you can carry it around if you go walking, jogging, hiking etc.

The first radio I bought is a used ICOM 02-AT, and that is the only VHF radio I have currently. I am thinking of getting a mobile now, but I think the HT is a good starter for someone on a limited budget because you can use it to figure out when and how you like to use your radio, and will always be handy to have around for travelling etc. even if you get mobiles or base stations later.

I remember reading somewhere that the term originated when the low-bands were popular and some amateur radio antenna builders used to placed a glass beverage bottle at the base of a tall vertical radiator as an insulator from ground.

>I'm intrigued about the methods of testing CW proficiency in the US. Is
>there both receive and transmit testing?

No, not anymore. The FCC (I think) decided that being able to receive code means you can also send it, so the sending tests have been scrapped. However, it was, and I think is still, in the rules that the testing team can require a sending test, but I don't know of any ever having done so since the change.

2612. Manual Request - AN/URM-25-F & PE-75W

Newsgroup: rec.radio.amateur.misc
Date: 1994-08-15 15:11:03 UTC
From: Schroeder.Wbst207V@xerox.COM
Message-ID: <"15-Aug-94.11:10:58".*.Schroeder.Wbst207V@Xerox.com>
Source record: 261709

I recently acquired a Military AN/URM-25F 10 Khz to 50 Mhz signal generator with mechanical problems. I am looking for a manual (original or copy) to buy or borrow & copy.

Also looking for information on a Military Surplus generator PE-75W.

Any leads would be appreciated.

Thanks,

Russ W2DYY

Schroeder.Wbst207V@Xerox.com

2613. Ham Radio & More Show List

Newsgroup: rec.radio.amateur.misc
Date: 1994-08-15 15:15:46 UTC

Ham Radio & More Station List:
The following list can change often....

Alabama: WHRT, 860am, Hartselle
WAJF, 1490am, Decateur
Arizona: KFNN, 1510am, Phoenix
Colorado: KBCO, 1190am, Denver/Boulder
Conneticut: WATR, 1320am, Hartford
Illinois: WKTA, 1330am, Chicago
WBGZ, 1570am, Alton
Indiana: WIWO, 1580am, So. Bend (tape delay)
WPDJ, 1300am, Huntington/Ft. Wayne
Massach: WSSH, 1510am, Boston (50,000 watts)
WKPE, 1170am, Orleans
Missouri: WBGZ, 1570am, St. Louis
Mississippi:WVMI, 570am, Biloxi
N. Carolina:WEEB, 990am, Fayetteville
WCRY, 1460am, Raleigh/Durham
WNCT, 1070am, Greenville
Nebraska: KICS, 1550am, Lincoln
New Jersey: WIFI, 1460am, Trenton/Philadelphia
Oklahoma: KTMC, 1400am, Mcalester
Texas: KSEY, 94.3fm, Seymour

Ham Radio & More is on the Talk America Network. It is aired live every Sunday at 6:00pm EST, originating from Phoenix, Arizona. It can be heard via TVRO satellite on Spacenet 3, Transponder 9, 6.8 audio. Our toll free listener call-in line is 1-800-298-TALK. The originating station number is 1-602-241-1510 for more information. Any radio station can air the show FREE OF CHARGE.

>side?

The refitter buys the chassis from the usual truck manufacturers. School buses generally work the same way. The specialized equipment gets added, and you have your ambulance (school bus, tow truck . . .). The chassis and drive train are usually covered by the chassis manufacturer warranty, and the add on by the refitter. This sometimes causes "jurisdictional" issues. :-) I'm not in that business any more. :-) :-)

More to the point for the original question, Ed Hare at ARRL compiled a very good listing of auto manufacturer's (that is the possessive form, to borrow from another thread) policies for radio installation. Toyota was taught the error of their ways, but still left a bad taste in the mouths (plural) of several hams. It pays to understand the manufacturer's policy before approaching the dealer. They usually know little about radio beyond CB, and avoid implied warranty like the plague.

No offense to the old timers out there but have you ever noticed how often they key up on top of each other during a QSO? I do a lot of listening on the HF bands and I find the QSOs of most old timers very informative and very interesting. It drives me up the wall, however, when Joe keys up on top of Fred before Fred has unkeyed his mic. Now they're talking to themselves because both are keyed up at the same time.

I run across this at least two or three times a day. Those experienced rag-chewers key up their mics so long that they are required by Part 97 to identify at least three times before unkeying. A pause longer than three seconds is taken as a sign the other has unkeyed and, click, two simultaneous one-way transmissions ensue.

I really believe this is one place a "roger" beep would be practical. I'd rather hear that then to hear two stations talking as if they were in full duplex operation.

Comments anyone?

If you are an old timer and engage in actual "ragchew" please don't be offended by this post. It's just an observation. It might even get you to pause a little between turnovers -- just in case someone wants to break in. Or is this just your way of keeping the frequency from being stolen by the new breed of rude ham? Just curious...

Do you know what a D-104 "lollypop" is? They've got this little metal
ring that you can run up the mic to keep the PTT switch locked in TX.

It is routinely called, "The 75M death grip."

>directory used the ARRL directory as one of the sources. The ARRL
>sent me a letter "recommending" that I refrain from using their
>directory.

Didn't this issue get settled a little while ago ? I think that case dealt with telephone directories. Someone published a telephone directory that used a telephone company directory as it's data source. The phone company said that their directory was a copyrited listing. The courts said that if it was just a list then it couldn't be protected. I would think that the same thing applies to the ARRL directory. After all, it's just a list, except for the info in the front of the book.

The phone company used to put dummy entries, names and numbers that didn't exist in real life, in the telephone directory. That way they could look at a competitors directory and easily see of they copied the data. Is the ARRL doing the same thing with the latest repeater directory? There are a number of ommissions from the previous edition and a lot of errors have crept in. Look in the South Bend, Indiana 2 meter listing and see the repeaters whose input frequency is the same as the output!

I say go for it. What's wrong with the freq coordinators sending you a copy of their info when they send it off the the ARRL every year?

Should this discussion be moved to .policy?

> everyone on 160 meters. well... :)

Yep, Beverage antennas really work well on mf, we typically use 4
strung out in various directions for our dxpeditions to NW Scotland
each fall. Lengths are between 400 and 550 metres, depending how far
it is to the sea, and they're terminated at the far end with variable
resistors usually set around 500-650 Ohms.

They're appreciably directional, switching between antennas on say
1100 brings in either R Globo in Sao Paulo, ZDK Antigua or WWWE
Cleveland.

They're also very low angle, with Alaska for instance still making it
over the dark North Pole at 1430 UTC (=our local time), and we've had
sunlight since 0930 UTC

Wayne has advocated these ideas for a while now :-)

His concepts about license class _might_ have some
merit in that it _might_ get hams out of sniping
at one another and instead advancing the various
aspects of the hobby.

My only question is about schools. The system isn't
working now to teach basic academic studies. When
it comes to technical subjects things get worse.
And where does the funding come from? Most schools
that have computers have old model Apples (not Macs)
or low-end PC clones with inadequate memory, drives,
displays, and worse software (and often have only
bought ONE copy of DOS for all the machines). The
teachers (mostly) are not computer-literate and I've
talked to many (in several states/regions) who have
not even computerized their gradebooks. (Which really
ought to be minimum teacher usage!)

Obviously if you're talking about adding amateur
radio into the schools, you need decent donated
equipment (keep your SB-100s and give the school
at _least_ a current entry-level soldi-state hf
transceiver, a decent packet station, and good
antennas that are solid and well-placed to do the
basics and also do SAREX). Then you need knowledgable
volunteers who can teach the material AND reach the
age group involved. And coordination that makes a
shuttle launch look like childs play!

Maybe we ought to move this to .policy :-)

Cheers & 73 Ed Humphries N5RCK
Hewlett Packard NARC Atlanta GA

> ought to be minimum teacher usage!)

I don't agree with that opinion. I still do a lot
of teaching and have generally rejected computerizing
my gradebook. I've given it several attempts and the
most productive one was a gradebook program I wrote
myself. But, even in this one there wasn't enough
flexibility to handle the needs of individual classes,
weather schedules, emergencies, etc.

It is a common delusion to assume that computerizing
something is inherently "better" than the manual
version of something. Perhaps, in your mind that
makes me "computer Illerate", but I prefer to keep
control of my grade recording and reporting mechanism
myself. Computer just gets in the way. I don't have
single classes of more than 30 or so and I don't
need a computer to help me keep track of 30 or so
people at a time. Just a waste of a computer resource
for me. Others I know find the computerization has
made them more productive and for them computerization
is great. It is for the individual teacher to decide
not for those not on the spot.

Continuing this thread of "specially prepared" there are thousands of
trucks which have all sorts of contemporary electronics (ECUs, etc.) that
are not designed with radios in mind but are regualarly fitted with
such equipment. I agree with the sentiment that says...if the
manufacturer is going to claim using a ham radio will void the
warrantee, then forget buying the manufacturer's product line.

My township buys plain old vanilla cars for its fleet (i.e. we have
a jeep, several compacts, etc.) none of those are special police
equipped...BUT all have two way VHF (45MHz) radios.

Standard Disclaimer- Any opinions, etc. are mine and NOT my employer's.

On HF? I hear it all on the time on VHF. Keying all over each other,
timing the repeater out and this is all in the presence of a courtesy
tone. And yes, it's usually a fossil call sign that causes the problems.
(Please note that a Fossil is anyone who can remember when you had to
touch two wires together for CW.)

Nope. Roger-beeps are for lawbreaking CBers and other scum. With proper On-
the-Air skills, this need not happen. SLOW KEY YOUR MIC! Dont assume he's off
the key, wait till he turns it over to you, If he's been keyed-up long enuff
to qualify for a broadcasting award - tell him nicely on the next go round, in
a nice way - like: "Hey Joe, we decided you need a Push-to-Listen switch!"

Second point: Fixed rotation in nets. Yeah it seems dull, but what's the real
alternative? Buncha people keyed up...noone listening...Lid Net! So to avoid
the "all-together-now" keyup...use a fixed rotation scheme, Im after N6xxx and
then pass it to WA4yyy and so on. All the traffic/MARS nets do it, there must
be a reason!

>If you are an old timer and engage in actual "ragchew" please don't be offended

Actually, ragchew is just an extended conversation, the exchanges CAN be
brief rapid-fire and not the 10 minute monotone broadcasting that sometimes
try to be called ham radio. I noticed one OF that was exceeding 25 minutes
per keyup on 80m AM..the group just left him after a few go-rounds...poor

feller! Must be a drag...somebody should clue him in!

From: sufana@ceco.ceco.com
Message-ID: <CuLDnw.36G@ceco.ceco.com>
Source record: 261609

Larry,

I posted a similar question about a month ago for my 94 Dodge Caravan and got some help but not really what I was looking for. I finally had to do more investigating on my own. Here is how I brought DC power into the radio. I have power door locks and power windows, so there is a rubber hose/grommet between the door and door frame for the wire to run within. I took a side panel on the passenger side out temporarily and pulled back the grommet and punched a hole through. I have small hands so I was able to do all of the work on the grommet with the door open. I was then able to run DC power cable down through the fender on the passenger side and fed it through the hole in the hose/grommet. You can then pull the wire through a hole in the door frame and into the interior with no problem. I couldn't really decide where to mount my 2 mtr radio, so I bought a transmission hump mount from Radio Shack and laid it flat on the floor (this model has 2 "wings" that are hinged to the mount that I have since removed). I use a mag mount antenna and run the cable out the door.

Hope this helps.

73s.

Message-ID: <9.1867.4926.0NEC3C56@dkb.dk>
Source record: 261578

I have the opportunity to purchase a Drake SPR-4 Shortwave receiver.
Can anyone give me some info on this model. I'm new to DX'ing. My
primary interest is Fax, RTTY, Packet and listening to the big
European SW stations.

The ad' states that it's range is 200khz to 23Mhz am/cw/lsb/usb.

What about 23Mhz to 30Mhz, is this important?
If so, can it be modified to receive 23-30Mhz?
How old is this model?
What would be a fair price to pay for this unit?

Any help would be greatly appreciated.

Thanks,
Graham. graham.davies@dkb.dk

: line transmission line if the separation and dielectric constant are known,

I hope you are going to confirm your calculations with actual measurements.
I suspect the impedance is a strong function of how tightly the wires are
wrapped which would be hard to calculate theoretically. Rather than doing
the calculations, why not just wrap a few, measure them and do a
heuristic curve fit?

Bill,

Check with Downeast Microwave on their switching boads. They sell a small board that includes the input (IF) relay and drivers for use with your IF rig. It's small enough so that you usually put it inside the chassis for the microwave transverters that they sell.

While not exactly "new" the 146.775 (131.8 PL) repeater in Wildwood NJ has
made some major improvements since last year and has much wider coverage. I
hear guys in Delaware on it all the time. It also has a remote base which
links it back to N3KZ University of Pennsylvania system (443.8) which covers
practically the entire southeastern quarter of Pennsylvania.. and then some.

>flexibility to handle the needs of individual classes,
>weather schedules, emergencies, etc.

A common problem: I, on the other hand, found some wonderful
software that was very flexible (almost too much so one might
say, but fortunately the defaults were intelligent). I do know
teachers who have adopted some software I recommended and have
been VERY happy with it. Teachers should NOT be required to
write their own program for gradebooks: in fact, that is the
antithesis of the basic purpose.

>It is a common delusion to assume that computerizing
>something is inherently "better" than the manual
>version of something. Perhaps, in your mind that
>makes me "computer Illerate", but I prefer to keep
>control of my grade recording and reporting mechanism
>myself. Computer just gets in the way.

Egads, I'd hoped that on this forum no one would resort to
setting up and fighting a strawman of their own construction!
Did I _say_ that computerization (as a generalization) is
inherently "better" than the manual version of something. You
argue from my specific instance to a gross generalization AND
attribute motives and attitudes to me that don't exist. Please.

I would certainly NOT call someone who who their own gradebook
program as "computer illiterate". Of course, the purpose of a
computerized gradebook is to _increase_ control of grade recording
and reporting while also improving the accuracy and uniformity.
One of my son's high school teachers managed to drop a grade from
his average and (since it was a top score) managed to record a
full letter-grade lower than my son's average should have been.
That would not have happened had the books been computerized.
I'm not sure how a computer can "get in the way" any more than
the paper gradebook does (not to mention the tedium of posting,

averaging, running stats, etc).

>I don't have
>single classes of more than 30 or so and I don't
>need a computer to help me keep track of 30 or so
>people at a time. Just a waste of a computer resource
>for me. Others I know find the computerization has
>made them more productive and for them computerization
>is great. It is for the individual teacher to decide
>not for those not on the spot.

Typical short-sightedness if you ask me. The benefits of
a computer program only _start_ with the teacher. As you
should know, every grade you post has to be reported up:
maintained at the school level, the district level, and
often up to the state level (not to mention in-betweens).
If YOU don't keep computer records, the next level must.
And so on. Where is the cheapest best point of collection?

Their are lot's of things _I_ want to control when I teach.
But there are lot's of things that are givens: a uniform
gradebook system is usually one of them.

>73, Erich

>There might be other things to look at, modulation distortion, etc...

Ok fellow radio amateurs, here's an aspect of amateur radio I hear talked
about quite often and everyone has an opinion. Any EXPERT opinions out
there?

The following are just GUESSES on my part...

Take the popular transmitter "finger printing" software/hardware advertised
in the back pages of QST. Take 20 cheap radios (Alinco DJ180T) and see
if this "fancy software" really can uniquely identify EACH AND EVERY
radio without error in a random run of 1000 key-ups. Any guesses
on accuracy??

Also, say your fancy fingerprinting data base DOES catch me on a repeater
input freqency (this DOES require catching ME and not the repeater,
right?). What happens if I change antennas? Power levels? What happens
as my radio ages? Will the signature in you data base now match my
radio under the new conditions?

How high of a sample rate is required to actually get accuracy in
a 146 MHz transmitter finger print? ;-)) Nyquist says at least
twice that, right? Must be some damn powerful hardware out
there selling dirt-cheap in QST! ;-))

Are these fingerprinters using time-domain analysis, freq domain or
both?

Given all of the above, does transmitter finger printing really work?
Has it ever stood a test in a court of law?

If it DOES work, it still assumes the fingerprint you initially captured
was obtained along with a valid call sign. This does NOTHING to
catch pirate operators and freebanders.

Hmmm, interesting. Actually the term refers to a long (1 or more
wavelengths) wire antenna a few feet off the ground which is used
to receive the lower frequencies. It is named after H. H. Beverage,
a radio pioneer back in the 20's and 30's.
Long beverages, like the ones you drink, are better... up to a point!

John:

I have traveled with a portable shortwave radio for over 10 years
Internationally without any real problems. Infact I once lugged my ICOM
R71A to Fiji (stupid move...I used it once in 3 weeks). Here is my advice:
Never offer any information or explanation without being asked first.
When asked, make your answers short and simple w/o any tech mumbo jumbo.
Don't try to hide anything or be conspicuous (like on your belt).
Remember, customs officals have all day to do their jobs and sometimes
just like to excersize their authority. I have no experience in taking
ham gear overseas so I can't help you there.

2644. DSP Comparison: Timewave vs. WG9R

Newsgroup: rec.radio.amateur.misc
Date: 1994-08-15 23:08:30 UTC
From: Wayne_Estes@csg.mot.com
Message-ID: <9408151807.ZM13710@SALCIUS2>
Source record: 261595

This weekend I borrowed a friend's W9GR DSP II to compare with my Timewave DSP9+. I did the comparison listening to SSB and CW signals on 2 meters, 20 meters, and 40 meters. The "rankings" were the same on all three bands.

NOISE REDUCTION:

On all bands, the W9GR "optimized noise reduction" was much more effective than the Timewave "aggressive" noise reduction. The W9GR gave more noise reduction, with less voice distortion than the Timewave. The Timewave "less aggressive" noise reduction also distorted the audio more than the W9GR did.

The Timewave noise reduction attenuated the lower voice frequencies, and added significant high frequency ringing to voices. The resulting tinny, distorted sound was only slightly more intelligible than copying a weak signal without noise reduction.

The W9GR, on the other hand, retained the full voice frequency response without adding significant distortion. The result was a significant improvement in the intelligibility of SSB signals that were buried in the noise. The W9GR "combined notch and noise" reduction did not reduce noise as well as the "optimized noise reduction" mode, and the "combined" mode also introduced some high and low frequency ringing (but not as bad as the Timewave's ringing).

NOTCH FILTER:

The Timewave notch filter was superior to the W9GR notch filter for continuous carriers, carriers with rapid fading, and for CW signals.

The Timewave notch filter was faster and deeper than the W9GR notch filter. The Timewave notch filter also has some "hang time" that causes the notch to stay engaged during rapid fades. The Timewave notch filter added very little distortion to the desired voice signal.

The W9GR "combined notch and noise reduction" mode did not give a very deep notch (about the same depth as the IF notch filter on my Icom 751). The W9GR "optimized" notch filter was deeper, but still not as deep as on the Timewave. The W9GR "weak signal" notch filter add a lot of distortion to the voice signal, and was not pleasant to listen to.

BANDPASS FILTERS:

Both models had excellent CW bandpass filter performance. I prefer the Timewave 500, 200, and 100 Hz bandwidths over than the W9GR bandwidths of 200, 100, and 30 Hz.

The W9GR does not have bandpass filters for SSB, which was a problem for me. My Icom 751 audio output has high and low frequency noise, which passes

straight through the W9GR. To compound the problem, the W9GR generates its own high frequency hiss. I am using high-fidelity Sennheiser headphones, but my friend also hears the hiss on his Heil communications headphones.

The Timewave Voice mode includes a 300-3000 Hz bandpass filter which eliminates the high and low frequency noise from my Icom 751. And the Timewave does not add any hiss of its own. The "medium" and "narrow" voice bandpass filters are only needed when using an older transceiver with a wide IF and no passband tuning (they helped a lot on my old Ten-Tec Triton IV).

RFI IMMUNITY:

The W9GR filter is very prone to RFI, even when all the connecting cables are wrapped around toroids. Consequently, one must turn the receive volume down when transmitting. (My friend and I both run 100W HF with RG-8 to verticals about 40 feet away).

The Timewave is less prone to RFI. If RFI is experienced, the Timewave DSP-9+ PTT input can be connected to the transceiver to mute the DSP output when the transmitter is keyed. This feature is great for HF, but is not desirable when operating full duplex on satellites.

CW SIDETONE:

The W9GR CW filter will block the transceiver's CW sidetone if the sidetone frequency does not fall within the CW filter passband.

In CW mode, the Timewave PTT input has a different function: The audio filter is bypassed with a relay when the transceiver is keyed. This allows the transceiver's sidetone to pass through to the speaker/headphones, while still eliminating any RFI in the DSP.

DATA:

(comparison based on reading the W9GR manual, and actual tests of the Timewave)

The W9GR has fixed-bandwidth data filters, but the center frequency can be switch selected for the standard Packet mark/space frequencies or for the standard RTTY/AMTOR/PACTOR mark/space frequencies.

The Timewave has several front panel selectable data filter bandwidths, but the center frequency is only selectable by an internal jumper. This may or may not be a problem depending on your TNC model.

Note: I believe that the above comments about the Timewave DSP9+ are also applicable to the Timewave DSP9, except that the DSP9 does not have the following features: Data filters
PTT input
Hard-wire relay bypass when power is off
AGC

CONCLUSION:

If noise reduction for weak signal SSB is most important to you, then the W9GR is preferable to the Timewave. The W9GR is great for Oscar-13 !

If Bandpass filters, Notch filters, and RFI immunity are most important to you, then the Timewave is preferable to the W9GR.

Thanks to Scott Migaldi, KF5JQ, for loaning me his W9GR filter.

If anyone has done side by side comparisons of the JPS or MFJ filters compared to Timewave and/or W9GR, I hope you will also post your observations to the newsgroups.

Why, if both repeaters and auxiliary stations can be automatically
controlled, do you need remote control? Use a time-out timer and
you're ok.

>input freqency (this DOES require catching ME and not the repeater,
>right?). What happens if I change antennas? Power levels? What happens
>as my radio ages? Will the signature in you data base now match my
>radio under the new conditions?

Probably yes. Power level and antenna are irrelevant. Aging of the
radio is probably not that important either as aging mostly
changes the absolute frequency of the carrier. You are right about
the repeater -- you have to catch the input signal, not the repeater.

>How high of a sample rate is required to actually get accuracy in
>a 146 MHz transmitter finger print? ;-)) Nyquist says at least
>twice that, right? Must be some damn powerful hardware out
>there selling dirt-cheap in QST! ;-))

Ahh, another person who doesn't understand the Nyquist theorem.

>Are these fingerprinters using time-domain analysis, freq domain or
>both?
>

Transmitter fingerprinting uses the settling characteristics of
the synthesizer inside the radio. It looks at the frequency vs. time
characteristic of the radio as it is keyed up. Needless to say, you
don't need to digitize at 2x146 MHz. The settling behavior is
controlled by the loop filter inside the synthesizer, along with

the VCO. This is not a controlled characteristic in the sense
that manufacturers don't try to make the radio settle in any particular
way. Because of the way these synthesizers work, the loop filter is
fairly narrow, which makes for a long settling tail, which makes for
an easy signature.

All you need to do is to mix the incoming signal with a LO of the
carrier frequency. The difference mix product is the error of the
offending transmitter with respect to time. Remove DC to take care
of master reference crystal error/drift due to age/temperature, and
you have the dynamic characteristics of the radio. I suppose if you
went in there and kept on tweaking the loop filter after each time
you were obnoxious, it would make life difficult for the fingerprinter.

Anyone who knew enough to do that without breaking the radio should
have much more productive things to do than to committ acts worthy of
fingerprinting.

So in summary, fingerprinting is a good way of tracking down jerks
on repeaters. Of course, to do it right costs a bit of money
in equipment. I can't vouch for the product advertised in QST.

It probably won't stand up in court, by itself. It is more or
less a tool to determine who the suspects are, and then one can
use more traditional methods to proceed.

I thought the control operator of any station had to have the means to
immediately shut down the transmitter. Time-out features aren't the same
thing.

2650. Re: Commercial Radio Telegraph License

Newsgroup: rec.radio.amateur.misc
Date: 1994-08-15 23:57:50 UTC
From: drt@world.std.com
Message-ID: <CuLp8F.MzJ@world.std.com>
Source record: 261589

twp77@isuvax.iastate.edu wrote:
: This thread got me wondering. (I know this isn't amateur radio, but
: I'm curious.)

: What is required for the Commercial Telegraph licenses? What is the
: difference between second and first class? (Is there a third class?)
: If I wanted to try this, what would I--as an Amateur Extra--have to do?

: Thanks in advance for any information that may quench my curiousity.

The only difference between T-1 and T-2 is that only a T-1 can be the *Chief* Radio Officer on a passenger vessel that must have a telegraph station. T-1 requires the same written tests T-2 does, plus a harder code test (25 wpm plain and 20 wpm groups, one minute perfect out of five to pass; versus 20 plain/16 groups for T-2 and T-3). T-1 also requires a year's experience as a commercial radiotelegraph operator, so there's no hurry on that code test!

If you have your Extra license in hand, you are given credit for the code tests needed for the T-2/T-3. (If you got a handicapped exemption, you must tell the FCC when you apply, and you get a license with a restrictive endorsement.) You also have to pass or receive credit for the following written exams:

Element 1, Basic Law
Element 5, Basic Telegraph Practice
Element 6, Advanced Telegraph Practice and Radio Theory

You *don't* have to pass Element 3 - Radio Theory, which with Element 1 is required for a GROL (General Radiotelephone Operator's License). If you have a T-2 (or T-1), you can do anything someone with a GROL, or T-3, or MROP (Marine Radiotelephone Operator's Permit), or RP (Restricted Radiotelephone Operator's Permit) can do. The joker is that the GROL is a lifetime license and because of a legal technicality still carries no fee (well, not this week, anyway) other than the exam fee. The telegraph licenses, on the other hand, are good for 5 years and require the $35 FCC fee plus any exam fee to get the first time, and I believe it's currently a total of $80 to renew them. And, of course, if you plan to get the new GMDSS Maintainer license, you'll have to take Element 3 anyway, in addition to Element 9, since Element 6 doesn't count toward that license.

For telegraph licenses only you also need two passport-sized pictures of your handsome self, and a white envelope to put them in so they don't get lost.

You can't hold a T-2 and any of T-3, MROP, or Restricted Permit at the same time. You'll have to cough it up for cancellation. You can keep your GROL, though.

There is a T-3 (Third class, of course), but since it doesn't require theory, about all you can do is send and receive code at a Coast station. Requirements are same as T-2 but not element 6, just 1 and 5.

For anyone who'll be in the Boston area, there'll be a Commercial Exam in Cambridge at MIT on Saturday, September 10th at 10 am. We'll offer every element we have exams for, including elements 1, 3, 7, and 9, now plus element 8 for radar endoresement and, *IF* the examination papers arrive in time, 5 and 6 for telegraph, though please understand that that last can't be guaranteed yet. The fee is $35 per *license* you take exams for (not per element!). For more information, drop me email.

After looking in Part 97, this is the catch all:

97.105 Control operator duties. - (a) The control operator must
ensure the immediate proper operation of the station, regardless of the
type of control.

OK, so you're the control op. You need to have a method to "ensure the
immediate proper operation of the station." So, if you want to do it
by carrier pigeon, that's OK, but it has to be "immediate" -- no
time out timers allowed.

: this is considered a communication between the amateur station
: autopatching and the repeater, controlled by the control op, who is
: allowing third party traffic over "his" station via the autopatch. I've
: heard that some repeaters turn off their autopatch late at night when
: all the control ops are in bed to stick more closely to the letter of
: the law (and to prevent mischief in general).

: I'm sure others will have more to add to my answer.

: Mike, KK6GM
:

Then again, just for the sake of discussion...

This suggests that if the repeater in question had a link to 11 meters
(perish the thought...:)) then all would be okay??? The one-way

transmissions would be gone and the repeater would complete the requirement for an amateur station.

Just thought I'd toss that in for thought.

Hi all,
I tried to post this earlier but I don't think it made it. I was
curious if the Regency HR-2A (2 meter mobile crystal controlled) would be
a good radio to use for a packet xceiver? Do I need CTCSS tones to access
the node? And are crystals still available?

Now TWICE the number of outdoor Tailgate spaces are available...

********* $1 buyers discount with hardcopy of this notice ********

COMPUTERS - ELECTRONICS - HAM RADIO - COMPUTERS - ELECTRONICS

FLEA all SUMMER at MIT
August 21st, 1994
9AM-2PM

Come to the city for a great flea - plenty of free parking.

MIT's electronics and ham radio flea will take
place on the third Sunday of each month this summer,
April thru October.

There is tailgate space for over 600 sellers and
free, off-street parking for >1000 cars!

Buyers admission is $2 (you get $1 off if
you're lucky enough to have a copy of our ad)
and sellers spaces are $10.00-each at the gate.

The flea will be held at the corner of Albany and
Main streets in Cambridge; right in the Kendall
Square area from 9AM to 2PM, with sellers set-up
time starting at 7AM.

!! RAIN or SHINE !! Have no fear of rain, a covered
tailgate area is available for all sellers (6'8" clearance).

Talk-in: 146.52 and W1XM/R-449.725/444.725 (PL 114.8/2A).

Sponsors: MIT Electronics Research Society
MIT UHF Repeater Association (W1XM)
MIT Radio Society (W1MX)
Harvard Wireless Club (W1AF)

2661. clip art for QSL card

Newsgroup: rec.radio.amateur.misc
Date: 1994-08-16 03:28:10 UTC
From: msw1633@tamsun.tamu.edu
Message-ID: <32pboa$4j6@tamsun.tamu.edu>
Source record: 261602

Hello all,

I am trying to put together my own QSL cards using Canvas or whatever I can get my grubby little hands on. Does anyone know of a source of clip art suitable for QSL cards? Stuff like keys, microphones, radios, antennas, logos etc? I have ARRL and ARES logos in pcx and cvs formats already, but I cannot seem to find a repository of other stuff. Oh, yeah, how about state map outlines? Those would also be good....

If you have any you have scanned/created for yourself, in whatever format, that you wouldn't mind dropping into the public domain, let me know and I would be happy to zip all this stuff together and post to the net/submit to ftp sites.

Thanks to all

Mark - N5RJF

I sold my W9GRII due to ringing in CW mode. While I agree with
your results, and enjoyed the SSB and SSTV filters immensly, the
ringing in the CW modes was so bad the KAM couldn't even demoulate
CW never mind my tired ears.

When MFJ finally shops theirs, I'll report on it. They say that
there is NO ringing in CW with theirs. We'll see...

Greater than 2 MeV Electron Fluence for 15 AUG is: 8.0E+08

SYNOPSIS OF ACTIVITY

Solar activity was moderate owing to an M1/2N flare from
Region 7765 (S12W23) that maxed at 1251Z. It was accompanied by
a 2695 MHz radio burst of 250 flux units of 15 minutes duration
(tenflare). Region 7765 declined today in both white light and
magnetic complexity. No new Regions were numbered. Active
prominences were reported on the west limb near S04 and N09.

Solar activity forecast: solar activity is expected to be low. Region 7765 is still capable of C-class flares and isolated M-class activity, but the overall probability of energetic events is decreasing as the region decays.

The geomagnetic field has been mostly unsettled for the past 24 hours. Isolated periods at active levels were observed at high geomagnetic latitudes. Energetic electron fluxes at geosynchronous orbit were high.

Geophysical activity forecast: the geomagnetic field is expected to be unsettled tomorrow as the disturbance of the past few days subsides. A possible new disturbance could begin on the 17th in response to interplanetary effects with a long duration x-ray event near the center of the solar disk on 14 August.

Event probabilities 16 aug-18 aug

Class M 30/25/20
Class X 01/01/01
Proton 01/01/01
PCAF Green

Geomagnetic activity probabilities 16 aug-18 aug

A. Middle Latitudes
Active 10/20/40
Minor Storm 20/50/20
Major-Severe Storm 01/10/01

B. High Latitudes
Active 10/25/45
Minor Storm 25/50/25
Major-Severe Storm 05/10/05

HF propagation conditions were near-normal over all regions today. A minor SWF may have been associated with the M1.2/2N tenflare near 12:50 UTC and could have affected regions in all of Africa, Europe, and western portions of Asia. Effects may have also reached to eastern portions of North America. Propagation conditions are expected to remain normal over all regions until possibly the 17th when a possible flare-related coronal mass ejection (of the 14th) could arrive. If this disturbance arrives, high and polar latitudes could see poor propagation with increased levels of fading and periods of auroral absorption. Middle latitude night-sector circuits could also see minor signal degradation if this disturbance arrives. Otherwise, near-normal propagation should persist with only brief intervals of below-normal propagation for transauroral night-sector circuits.

------ ---- ---- ---- ---- -- ------ ------ --------------------------
NO EVENTS OBSERVED.

NOTES:
All times are in Universal Time (UT). Characters preceding begin, max, and end times are defined as: B = Before, U = Uncertain, A = After. All times associated with x-ray flares (ex. flares which produce associated x-ray bursts) refer to the begin, max, and end times of the x-rays. Flares which are not associated with x-ray signatures use the optical observations to determine the begin, max, and end times.

Acronyms used to identify sweeps and optical phenomena include:

II = Type II Sweep Frequency Event
III = Type III Sweep
IV = Type IV Sweep
V = Type V Sweep
Continuum = Continuum Radio Event
Loop = Loop Prominence System,
Spray = Limb Spray,
Surge = Bright Limb Surge,
EPL = Eruptive Prominence on the Limb.

It isn't all that many years ago that I remember hearing two guys in
QSO on 144.010, FM simplex. A third anonymous guy came on and told them
they were in the CW band, and they not only didn't understand that but
also demanded the third guy identify himself!

I'm not going to start a flame war, so I won't mention that this last
incident happened just after the first no-code licenses were issued.

Mark...

I cannot vouch for these sites/BBSs but I am about to begin collecting ham
clipart myself. Here are few sources I have collected but not yet tried:

Gallery BBS: 202-298-6009
Database of Tennessee: 901-855-4124/4127
oak.oakland.edu:/pub/hamradio

The first two claim to have loads of zipped PCX ham clipart. Not sure
about Oakland.

Good luck...Rob

Hello..... this would NOT BE LEGAL either, as you cannot cross Amateur radio with another radio service. My grandfather looked into this when he was setting up 6 gig links and had extra room. He asked a FCC official about using the 6 Gig links to connect amateur stations that the above response is what he got.

There was also a fad, 'way back when beer cans were still made of steel instead of aluminum, of soldering a stack of cans together into a vertical. Some wag remarked, "Now _that's_ a beverage antenna." Apologies to H.H. Beverage.

: After looking in Part 97, this is the catch all:

: 97.105 Control operator duties. - (a) The control operator must
: ensure the immediate proper operation of the station, regardless of the
: type of control.

: OK, so you're the control op. You need to have a method to "ensure the
: immediate proper operation of the station." So, if you want to do it
: by carrier pigeon, that's OK, but it has to be "immediate" -- no
: time out timers allowed.

: ==Ken

Ah, semantics. I don't read the term "immediate" that way. There's
no way to *ensure* "immediate" (in your sense) shutdown even with a
control link, because the control link can break - or run out of
batteries! - hence the requirement for a time-out timer under
telecommand. That must mean that 3 minutes is immediate enough for
the FCC. (Those poor pigeons aren't as fast as that, anyway! :-)

A number of months ago people around here were forced to DF a
transmitter. Seems a TNC got stuck in the "on" position. Of course,
the licensee wasn't home and didn't have a remote link to turn the
thing off - he had to go home and do it. Now, I wasn't aware people
with packet stations had to have a remote link to turn the things off
in just such a case, and it's my impression that nobody has them even
though they leave them on all the time. Is that impression mistaken?
Your claim implies that the remote link is required, but I would think
there'd be plenty of warning in the "Getting Started on Packet" type
of articles - which there isn't. (Of course, in this case, that
timeout timer would have worked great.)

Plus, while you are the control op in your example, you are not at a
control point if the transmitter is under automatic control. If that
rule means you must be at a control point at all times to turn the
thing off at a moment's notice, there's no such thing as automatic
control, only remote control.

In a nutshell, I don't think that interpretation of "immediate" is
consistent with the plain sense of other provisions of the rules, and
I don't see that people have ordinarily been interpreting it that way.

>exams were the same.)

They split off the General questions from Tech in 1987, long before the
code test free Tech license came out. The idea was that the Techs didn't
need to know the material on HF propagation, operation, and rules since
they couldn't operate there. That made sense, but the FCC screwed it
up. Instead of increasing the VHF+ questions, they just divided the
old written in half because it was easiest for them to do. That made
the Tech written too easy.

: twice that, right? Must be some damn powerful hardware out
: there selling dirt-cheap in QST! ;-))

The Nyquist criteria doesn't apply to 146 MHz. We can reasonably assume
the signal is bandwidth limited for our purposes. If we sample at twice
the maximum expected modulation rate, we will meet the criteria.

Actually, it may be argued that the Nyquist rate doesn't apply.
We are merely trying to determine signals uniquely, not reproduce
them precisely. This is the basis of fingerprinting. You don't
need a full color 3 dimensional image to incriminate someone, much
less enough information to clone someone. :-).

: The standard treatment would be a couple of 2.5mH chokes in series
: with the leads, and a .001 disc ceramic capacitor across the line.
: However, if these are the type that talk to each other via carrier
: current on the AC line so that all of them sound when one detects
: smoke, you can't do this. You may be hosed. Your other alternative
: is to try to get the 40 meter energy away from your wiring. Locate
: your antenna higher and/or further away from the house.

Gary is right; the chokes might interfere with the communication between the
smoke detectors. In any event, it is not a good idea to put capacitors
across an AC line unless the capacitors are *AC* rated.

The house wiring or interconnect wiring is probably resonant on 40 M.
In most cases, RF pickup on the AC lines is going to be common-mode, with
all three wires acting as if they were one wire. Get some FT-240-43 ferrite
cores (Ocean State Electronics has them in stock, credit card okay,
reasonable minimum order tel (401) 596-3590). You may have to extend the
length of the wiring, but if you wrap 5-10 turns of the AC and/or
interconnect wiring (all the wires wrapped together) onto the ferrite core,
it will usually choke off any common-mode signal without affecting the
desired signal that connects all the detectors together.

I would first simplify the system a bit, perhaps with two units wired
together, just to find out which wiring or units are suspectible. Add the
other units back one at a time, debugging RFI as you go along.

If you happen to have some ferrite material laying about, go ahead and try
it. But if it doesn't work, don't assume that using the correct #43 material
won't work. I am always hearing tales of folks who buy "generic" toroids, or
use a single split bead, or one of the RS snap-together chokes, or the old
yoke from a TV set, only to find that they don't always work as well as one
might expect. The general rule is that if it fixes the problem, it is okay
to use, but if it doesn't, try the correct material before you give up and
go onto something else.

Source record: 261619

>The annual Melbourne Florida HAMFEST, sponsored by the Platinum Coast
>Amateur Radio Society (PCARS), will take place September 10 and 11, 1994.

set up on the 9th. General info send SASE to Hamfest Information, Platinum Coast Amateur Radio Society, P. O. Box 1004 (closest they could get to 10-4 at the time - it was during the CB boom), Melbourne, FL 32902-1004. Or call Allen Hudson at (407) 777-1120. Tables - call Janet Madden at (407) 724-9339. Last I heard, swap tables were just about gone and the mail backlog would be cleared up by this evening. PCARS BBS is (407) 729-9061, up to 14.4 kb.

>This was one of Florida's best last year, and hopes to be even better

yep -- i think it will be -- look for the collins amateur radio club table on the inside in the air conditioning...the hamfest isn't all in the parking lot.

>this year! Only two-three miles east from Interstate 95, exit 71.

oops. it's about 5 miles from the interstate just to Babcock St. and that's also agreeing with the "Hooters" sign. i think 3 miles just gets you to the Melbourne Square Maul 8).

Easy directions: (talk in? we don' need no steenking talk in!)

I-95 to US-192 exit. (New Haven Ave.)
US-192 to US-1 (east). (Harbor City Blvd.)
Turn left (north) - stay in left lane.
Go to next stoplight (about 2-3 "blocks" and is Hibiscus Blvd.).
Turn left (west) - stay in left lane.
Go about 3 blocks - you'll see the auditorium on the left.
Turn onto street just east of auditorium.
Parking lot entrance is on right about 1/4 way down the block.
Car pool if you can for Saturday Morning...parking is congested then.

(why no exams? we tried it for about 3 years...the facility doesn't have the space to hold the exam on site and the hotel doesn't have large enough meeting rooms to handle the crowds and there'll be an exam at FIT the next week anyway. so us examiners go to the show like everyone else...)

2680. Lafeyette receiver documentation sought

Newsgroup: rec.radio.amateur.misc
Date: 1994-08-16 15:27:17 UTC
From: dgs@53iss6.Waterloo.NCR.COM
Message-ID: <CuMw9H.37A@attwat.Waterloo.NCR.COM>
Source record: 261623
Cross-posted to: rec.radio.shortwave,rec.radio.swap,rec.radio.amateur.equipment,rec.radio.amateur.misc

Hi all... I posted about this over a year ago and had no joy. I have
a bit of new info and thought I would try again.

I have acquired a Lafeyette KT-340 (tube-type) SW receiver with no
documentation. I believe this model may have been the kit version of
some other Lafeyette radio (HA-??? I saw one once that looked identical
and now kick myself for not looking closer). Anyway, I will describe
the set and ask anyone with a model like this (or a hollow-state
reference book listing something like this) to contact me - even if
it is just with the model number of the factory built version.

The set has nine tubes (1 5Y3G, 1 6AQ5, 2 6AV6, 3 6BA6, 2 6BE6)
with at least 3 big 455KHz IF cans. The console has the following
controls (left to right): Function (off/AM/Send/Q-mult), AF Gain,
Selectivity (locks fully CW at "AM/SSB" marking), BFO-Q Multiplier,
Band (4 position), IF gain, Ant Trim, AVC/MVC, ANL. Glass dial above
with S-meter on left side and Main Tuning/Bandspread dials to the right.

If someone recognizes my poor orphan, give a shout. I would be most
grateful (and pay for) for a user manual, schematic or especially
service/alignment instructions or copy of same.

.............Dave

What's the matter Ken? Two smileys in the above paragraph STILL
did not get across to you that it was a joke?? I guess I should
have put one after the second sentence too. <sigh> My fault.
Indirectly, the Nyquist comment did get you out of the woodwork! ;-)
Anyway, thanks for some interesting commentary that answered most
of my questions. I cannot speak for the originator, of course.

>So in summary, fingerprinting is a good way of tracking down jerks
>on repeaters. Of course, to do it right costs a bit of money
>in equipment. I can't vouch for the product advertised in QST.

I think catching them on the input is the biggest problem, HTs
being low-power devices and all.

>It probably won't stand up in court, by itself. It is more or
>less a tool to determine who the suspects are, and then one can
>use more traditional methods to proceed.

Any estimate on how much data is required to be saved in a single
"finger-print" record? You do seem to thing that the characteristics
will not change over time. Guess we'll have to see if it ever does
fly in the amateur radio community. I guess if you wanted to deliberately
be obnoxious, you could use a different radio only for that purpose.

From what I've seen here in Milwaukee, most of the repetitive and deliberate jammers are probably hams and/or know HOW to create havoc. They run very low power and move around, among many other techniques. I also think that many of the kerchunks are due to the impatient ones who cannot wait for their ticket to arrive and would rather kerchunk than actually get on the air with a licensed HAM as a control op, have some real conversation and actually USE the radio legally. Oh well, as you said: fingerprinting is just ONE tool to be used. 73.

2683. Ragchewing conversational protocol

Newsgroup: rec.radio.amateur.misc
Date: 1994-08-16 16:35:26 UTC
From: fkilpatr@afit.af.mil
Message-ID: <fkilpatr.777054926@afit.af.mil>
Source record: 261444

Hi All!

I just got my license a few weeks ago, and I noticed a conversational oddity that I hadn't expected. The simplex nature of conversation is kind of difficult to get used to. When ragchewing, you *have* to say something when the other person unkeys their mike. This is in contrast to normal conversation, where a person will usually continue to talk if a response is not elicited. Sometimes the person I'm talking to will stop talking, and I won't have anything to say. I feel like I can't just sit there, so I have to come up with some banal comment or something.

Obviously, this phenomena is less of a problem when there is an actual purpose to the QSO (like a contest or something). I'm curious to learn if anyone else has this problem, or are most people simply too talkative anyway? I'm currently taking a linguistics course, and we will be studying 'conversation analysis' in a few weeks. I'll report back if I find any theoretical foundation for this type of conversation anomaly.

From: ginsburg@wellfleet.COM
Message-ID: <9408161707.AA04568@pobox.wellfleet>
Source record: 261626

I have a G-1000SDX rotor and last night for the first time it started doing strange things. By strange I mean:

- while in motion it would stutter every 20 or so degrees for a half second then surge forward almost as if it was trying to catch up

- while in a resting position it would occasionally oscillate back and forth a few degrees as if it was correcting itself after a large gust of wind

- after power cycyling the control box, the oscillating disappeared

This behavior happened a few times last night, but not in the half hour before I went QRT, during which I exercised the rotor to observe more strangeness. It also didn't happen this morning while getting another half hour work out.

Has anyone else observed such behavior, and if so, what's the fix?

Thanks and 73,
Scott

This is a real old rig, and may have been designed to handle wide
band (+-15khz) FM. If so, you will be hearing signals on adjacent
channels. I ran into this problem with an old Icom IC20. Had to
swap out the IF filter.
If you have the manual for it, check the rx selectivity specs. You
could also use sig-gen to test it.

I know of five TNC2 clone designs available in the UK, or you could ask
TAPR if they still do one themselves. By using one you have the
advantage of being able to run all sorts of different bits of software
depending on your current fancy. Be careful about which modem chip a
particular design uses though, because it appears that the 7910 is being
discontinued.

The answer to this is it's useable but not real good for packet. It has a
relay in ti to do T/R switching which is noisy and slow. Also, the relay
may give problems since it will have to work very hard in packet operation.
Crystals are available from a number of sources if you want to give it a try.

IMPORTANT ISSUES DISCUSSED AT RAC CONVENTION IN CALGARY

The rapidly changing face of amateur radio was evident at the annual Board of Directors of Radio Amateurs of Canada (RAC) meeting in Calgary on July 27 and 28.

Here are a few highlights of the many important issues confronted by RAC's Board:

RAC's Board elected a new streamlined executive with Farrell Hopwood, VE7RD, as President; Tim Ellam, VE6SH, as First Vice-President; Jim Dean, VE3IQ, as Vice-President Government Affairs and Ken Pulfer, VE3PU, as Secretary-Treasurer. In addition, the Board appointed executive assistants Debbie Norman as General Manager and Tim Ray, VE3XV, as Honourary Legal Counsel.

In keeping with the federal government's desire to have amateurs control their own destiny through the delegation of the administration of the Amateur Radio Service to RAC, much attention was devoted to the progress of the joint RAC/Industry Canada working group.

Jim Dean, VE3IQ, apprised the Board of the significant progress made in only a few months toward amateurs taking responsibility for the process - operator certification, call sign assignment and document distribution. Issues of station licensing and spectrum surveillance and management remain at the stage of very early discussion.

The Board was pleased with the results of discussions with Radio Amateur du Quebec inc. (RAQI) to have that organization assist RAC in providing future delegated service to almost one-third of Canadians who speak French.

The Board members were encouraged by the progress being made in the band planning processes. Reports submitted by both the HF and VHF/UHF Band Planning Committees indicated that the work to arrive at a national consensus on these plans is progressing very satisfactorily. These volunteer band plans are well on their way toward completion and publication.

George Spencer, VE3AGS, Chairman of the RAC/IARU Niagara 95 Conference submitted a report on the arrangements and organization to host this important international conference. This is the first time Canada has had this privilege.

ELECTION NOTICE

ATTENTION RAC MEMBERS!!

An election for the full slate of candidates for the Board of directors of the Radio Amateurs of Canada will take place this fall.

The deadline for submission of nominations for candidates is rapidly approaching!

All nominations must be received at Kingston by September 1, 1994. Nominations must be signed by 10 RAC Members, and must be accompanied by a biographical sketch of up to 300 words in length. To be eligible, candidates must be full Members of RAC, and must be resident in the Region for which they are nominated.

The names and addresses of the present Board members can be found at the front of the current issue of The Canadian Amateur, with the exception of the Quebec Director, Jean Guy Riverin VE2JGR, who has resigned, and been replaced by:

Mr Pierre Roger, VE2TQS
330 Mozart E., #48
Montreal, QC
H2S 1B9

All nominations should be sent to:

RAC Administrative Office
P.O. Box 356
Kingston, ON
K7L 4W2

NEXT RAC PACKET BULLETIN

The print version of this bulletin is sent on the 15th of the month to RAC affiliated clubs, all Section Managers, Bulletin Managers and Official Bulletin Stations throughout each RAC Section. The packet and Internet editions are transmitted as soon thereafter as possible. The next regular bulletin should be transmitted on or about September 15, 1994. Watch for it!

No - most of the construction articles would be for RTTY terminal units, and pretty old now. Other than some of the now outdated packet-only controllers offered in the mid 80's, there have not been any construction articles I know of for an intellegent data interface. The closest you would have been likely to come was Heathkit's HK-232 clone of the AEA's PK-232, offered as a kit. Heath has been out of the kit business for about 3 years now, so unless you find someone who got a kit and never started it, you're pretty much out of luck. Part of the problem is that the companies that make the multi-mode TNCs have invested lots of money in the programming of their products to support the various modes, and are not interested in giving away their efforts. Also, since these are tightly integrated hardware and software products, the software wouldn't really work on anything else.

I have seen programs mentioned for non-intellegent interfaces usign a PC for the processing, as I'm sure you have, and that, combined with an older dumb modem or terminal unit design is going to be your best chance to get something going that you build. Even with the inexpense of used PC systems to dedicate, its usually not cost effective as compared to one of the commercially manufactured products.

Good luck in your search.

2696. CWIST Friday Night Fist Function

Newsgroup: rec.radio.amateur.misc
Date: 1994-08-16 19:39:45 UTC
From: rdkeys@csemail.cropsci.ncsu.edu
Message-ID: <32r4m1$iis@taco.cc.ncsu.edu>
Source record: 261435

OK, folks, here is the weekly posting for the CWISTS.....

Because of certain net folk not wishing to see this posting repeatedly,
make sure you make a copy of it for reference. I will post only short
form announcements from this time on.

This time we are going to try a departure from the normal for the CWISTS.

First, I am recommending that each time zone meet at midnight local time
rather than one time at 0400UTC. This will hopefully spread the load
out across the country and around the world, so all hands aboard can
find some CWISTS to QSO somewhere. This will also allow some folks who are
not used to being up late pounding brass to check in an hour or two earlier
from the western edge of the propagation or later from the eastern edge of
the propagation.

Second, I am going to QSY this week to 40 meters from 80 meters to
see if we can pick up a few additional folks on the 40 meter QRG.
I will keep the main rig on the 80 meter QRG in case someone tries
that, starting at 30 minutes past the midnight hour.

SU THERE OM/YL AND ALL HANDS ARE WELCOME TO JOIN IN ON THE FUN

73 TU SU DE NA4G BOB AR

****

Greetings CWISTS, Boatanchorites, QRPites, Fellow Hams, et al:

I will be on again at the appointed midnight hour for the continuing saga
of the Sacred and Most Honorable Friendly Society of Brass Pounding Fist
Functioning CWISTS.

THE APPOINTED TIME IS CHANGED TO MIDNIGHT LOCAL TIME.

THE PRIMARY QRG IS 40 METERS (7102.5 KHZ) THIS COMING FRIDAY NIGHT.

THE ALTERNATE QRG IS 80 METERS (3702.5 KHZ) THIS COMING FRIDAY NIGHT.

There has been a lot of interest on the rec.amateur.radio newsgroups
on sending CW and the general poor quality of many fists these days.
Let us do a little to promote, not only the art of receiving CW
radiotelegraphic communication, but also the art of ...sending... good
CW radiotelegraphic communication. It is perfectly fine to have an
individualized fist, and it is often easy to tell who is aboard on watch
at the key, just by the first few characters received, but it ...should...
be a point of pride and operating skill to be able to manually send
characters of sufficient integrity as to be readily received by all who
might be in a position to hear same.

So, let us all see who will be on watch this coming friday night
(saturday morn 0400UTC). Run your treasured boatanchor if you can, or
even that newfangled rice box supreme, or even that fine homebrew QRP rig.

Definition: A CWIST is a person with an active interest in the PRACTICE
and USE of continuous wave radiotelegraphy as directly is
appliccable to amateur radio. Such PRACTICE and USE may
take the form of learning about radiotelegraphy and its
history in amateur/commercial areas, its application to radio
telecommunication, the practicing of the art and craft of
radiotelegraphy, and the refining and developing of the
technology of radiotelegraphy.

The general information is:

++
+ CWISTS Friday Night Fist Function +
++
+ +
+ Standard time: Friday Nights at MIDNIGHT LOCAL TIME +
+ +
+ Standard freq: 80 meters --- 3702.5 khz for all hands. +
+ 40 meters --- 7102.5 khz alternate, for all hands +
+ (between the heterodynes) +
+ (someone scout out a better QRG) +

+ ___ +
+ Standard calling signal: CWIST IMI DE <yourcall> K (if there +
+ are no control stations calling for +
+ you to check in), or, +
+ CWIST DE <yourcall> K (if there is a +
+ control station inviting checkins) +
+ (The alternative check in for those OTs +
+ with salt behind the ears is a simple +
+ DE to get the control station's ears +
+ followed by DE <yourcall> K when the +
+ control station acknowledges.) +
+ +
+ Note: A simple informal net style protocol will generally be +
+ used, unless no control station assumes control for the +
+ evening, in which case it is an open roundtable format +
+ discussion group. +
+ +
+ Note: The midnight local time gathering is designed to maximize +
+ the number of checkins spread out over the world, so less +
+ confusion and more checkins are heard. The hope is that +
+ someone will be aboard almost anywhere and be heard at +
+ least locally, anywhere in the world. +
+ +
++

Let us all work together to continue to advance and promote the friendly use of CW on the amateur radio bands.

Let us continue to assist and help the newcomers and slowspeeds who are trying to get their CW going.

Let us to continue to promote the use of whatever gear you have up and available, be it the newest of sorts or the oldest boatanchor. Remember, CW generation has not changed since the days of Poulsen arcs, Alexanderson alternators, and Pliotrons.

Let us continue to promote the sharing and fellowship of the history and traditions of amateur radio (this includes all you OTs out there that have all sorts of goodly tidbits of history to relate to the young squirts on the block, and it includes all you young squirts on the block who, even though a bit new at CW and radio are the future of the service or hobby or profession).

Let us continue to promote the ``elmering'' of all of our new folks by the old timers aboard, in any way that we can. We should not be out to convert the brethren to CW, but should be there to elmer them and assist them in learning/practicing their skills, if possible.

So, OTs aboard, young squirts in the wings, high-speed afficionados of the art, and slow-speed ragchewers, join in on the fun. If your equipment is old boatanchor, so what. If your signal is a bit weak or chirpy, so what. If your antenna is just a mere piece of wire up into

the trees, so what. YOU can still join in and participate.
YOU are the folks who will make it what it can be, a goodly learning
time and an enjoyable evening for all.

See You There OM/YL.....

2698. License Frustration

Newsgroup: rec.radio.amateur.misc
Date: 1994-08-16 20:02:05 UTC
From: kgk@nwu.edu
Message-ID: <kgk-1608941504160001@kgkmac.repoc.nwu.edu>
Source record: 261381

Frustration is starting to set in, waiting for my license. It's been 8 weeks and 4 days, but that's not the frustrating part. Four of us went and took our tests together and the other three got their license's yesterday. (Not too bad, 8 weeks 3 days). I thought maybe it got delayed in the mail, but still had not come today. Sooo I decided to give Gettysburg a call. They have me in the computer as having received my application, but it has not been processed. They could provide not other information other than my application has been received and not yet processed.

My thinking is that all four applications would arrive in the same envelope and all four should have been done at the same time. (The other three have concurrent call signs). They could not answer if my got lost in the office or provide any information. I thought if it was lost, they could immediately start working on the process to correct that. Now it appears all I can do is wait and see what happens.

Sorry about taking up space, but I feel better getting this off my chest.

Thanks
Ken
(Still waiting)

I knew there was a good reason for collecting and keeping back issues of
the various ham rags. I periodically browse through them to either learn
or reinforce the knowledge of something.

Going through the June 1982 "Q-STreet" I found an article about Harold Henry
Beverage, ex-W2BML, inventor of the beverage antenna and associated with the
likes of Einstein, Marconi, Armstrong, DeForest, Sir Watson Watt, Yagi, and
Irving Berlin.

The name for the antenna has nothing whatsoever to do with any type of bottles
associated with the drinking kind of beverages. Hahahahahaha hahaha ha ha.
I like that one reply. Heck, if you don't know the answer baffle 'em with
your BS. Yup.

2702. Kentrol 4.3 - Windows control of Kenwood HF rigs

Newsgroup: rec.radio.amateur.misc
Date: 1994-08-16 20:25:44 UTC
From: brian@kentrol.synapse.net
Message-ID: <brian.6.00146E66@kentrol.synapse.net>
Source record: 261451

****

KENTROL 4.3 RELEASED: NEW FEATURES! NEW INTERNET FTP SITES!

****

NEW VERSION

The latest Kentrol for Windows version has optional fine tuning steps.
And it's still the friendliest, smartest control/logging/memory mgmt
program available for Kenwood HF radios. Kentrol supports VGA/SVGA
displays so it works great with even notebook PCs. Version 4.3 offers
unmatched features: toolbar; scroll bar tuning; selectable bandspread;
selectable tuning steps; built-in US, Canada, Japan, and Region 1 band
plans; multiple band-stacking registers; memory file handling;
auto-logging of rig, band and UTC date/time, plus comments; keyboard
shortcuts; and much, much more. Edit or print logs and memory files. Full
search & replace. Great online help.

Kentrol is shareware. It costs only $59.95 to register from North America
or $69.95 elsewhere. Registered users get print & xmit enabled, more
memory sets, a 42-page manual and phone/net support. And registration is a
one-time cost; future upgrades are free for downloading.

NEW FTP SITES

Kentrol now has a home on the Internet -- its very own online archive,
acessible by anonymous ftp. Just point your ftp program at
ftp.synapse.net and get kentrl43.zip from the /pub/kentrol directory.

Kentrol is also available from major ham archives worldwide:

The Boston Amateur Radio Club archive at ftp.oak.oakland.edu has
kentrl43.zip in directory /pub/hamradio/pc/ham-utils.

The European site of choice for Kentrol is ftp.funet.fi. At that site the
pathname is /pub/ham/misc/kentrl43.zip.

An Australian mirror of the above is maintained at grivel.une.edu.au.
There, kentrl43.zip is in the /pub/ham-radio/funet/misc directory.

Oh, I forgot to answer the main question: "Where did Beverage Come From?"

Harold Henry Beverage was born on the island of North Haven, Maine.
Not only did he invent the antenna that bears his name he was also the co-
inventor of the "diversity reception system." But you knew that.

I believe I read it was after the last name of the inventor of the antenna. I know I read this in some old ham mag 20+ years ago and I very rarely forget unimportant stuff like this.

I only forget important stuff, like eating, plugging parking meters, etc.

Although I've been a ham for 30 years, I don't know if that qualifies me as an Old Timer.

In the days before PTT, a ham on AM often had to kick his receiver to standby, key his VFO, manually switch his antenna T-R switch and key his transmitter to go from receive to transmit. This does not make for zippy, short QSOs. Many of these individuals got in the habit of being extremely long-winded out of necessity.

Give the OTs a break. Most of them were once young tower-climbers like you, and most of them built their own gear and antennas.

2711. ADVICE on NEW HF rig wanted

Newsgroup: rec.radio.amateur.misc
Date: 1994-08-16 23:53:02 UTC
From: robin@oleum.zso.dec.com
Message-ID: <32rjgu$dq6@usenet.pa.dec.com>
Source record: 261445
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.misc

Hi,

I have been out of the HF rig buying scene for about 10 years, since I have never had any reason to update my ageing FT301D. However in view of the VAST differences between UK and US pricing, I think it`s time to make the change.

Does anyone have any recommendations/reviews on the more popular HF rigs, I particularly like the look of the TS-50, primarily as I like to do HF mobile work. A friend also said the Ts850 or 450 were 'good'.

Since I am not a code operator some of the bells and whistles may not be applicable.

I realise that this is a vast subject but am primarily I guess looking for personal experiences, reliablity is also a prime concern as I will be taking it back to the UK soon.

Thanks

Robin

2712. MFJ vs Radio Shack base antennas

Newsgroup: rec.radio.amateur.misc
Date: 1994-08-17 00:02:53 UTC
From: lynch@jump
Message-ID: <1994Aug17.000253.990@newsgate.sps.mot.com>
Source record: 261452

I am trying to decide on an antenna for 2m/70cm use at home.
Due to neighborhood restrictions, I must put the antenna in
the attic. I have seen two different ones so far that might
be good. The first is the MFJ-175. The other is from Radio
Shack and is referred to as the "Discone Scanner/Ham Roof Antenna".
Has anyone had any experience (good or bad) with either of these
antennas? Any other suggestions/alternatives?

From: gsmlrn@gsm001.mendelson.com
Message-ID: <1994Aug17.005637.132@gsm001.mendelson.com>
Source record: 261455

Robert J. Kinder (rkinder@gate.net) wrote:
: Has any used the "Code Quick" product by Wheeler Applied Research Lab to
: learn Morse code? Does it work? How well? Any comments?

I have. I had been trying since 1965 to learn the code. I tried all sorts
of things and had no luck. With code quick I passed the 5 wpm test
(100%, >2 min perfect copy) in about 2.5 months.

My son (aged 12) went from 0 wpm to 4 wpm in a month.

To me it's the best radio related thing you can buy. IMHO it's a bargain
at $39.95.

2714. Re: clip art for QSL card

Newsgroup: rec.radio.amateur.misc
Date: 1994-08-17 01:41:01 UTC
From: nyoung@desire.wright.edu
Message-ID: <1994Aug16.204102.24608@desire.wright.edu>
Source record: 261453

Just for the sake of starting a flame session, I don't
use clip art on my qsl. Of course, I don't have to,
because I print my with a printing press and rollers and
ink and all that. But if I were going to put graphics of
some sort on a qsl (other than the ubiquitous diamond
and such), I think that I'd try to find an artist who
could do a decent cartoon rendering of my shack. SOmething
along the lines of a picture of a trash can with wires
rising out of it like creatures in a Burroughs book.
And then there's the question of color. Are you gonna
do color separations. With hand set type, it isn't a
big deal. It's another press run, but I'm not in it for
the money. (There ain't no money in it. Computers took
care of that with digital clip art....)
Flame on. I'm like beyond bother at this point.

2717. EOSS 18 Balloon Flight in Denver

Newsgroup: rec.radio.amateur.misc
Date: 1994-08-17 02:56:55 UTC
From: rickvg@usa.net
Message-ID: <tnNKkSEHGYIH069yn@usa.net>
Source record: 261456

```
--------------------------
FLIGHT PROFILE FOR EOSS-18
--------------------------

LAUNCH DATE : August 20,1994

BACKUP LAUNCH DATE: August 21,1994

LAUNCH TIME : 16:00 UTC

LAUNCH SITE: NAVSYS Corp.
Monument, Colorado, USA
Take the Baptist Rd. exit from I-25, go west to
WoodCarver Rd. (the first left) then south to
NAVSYS Corp.

LAUNCH SITE COORDINATES: latitude 39.09165 deg North
longitude 104.87129 deg West

FLIGHT EXPERIMENT: Flight Qualification of the payload stabilization
system. Otherwise known as the "despin device"

EXPERIMENT CONDUCTED BY: Larry Cerney/N0STZ

PROJECT INTEGRATOR: Larry Cerney/N0STZ

FREQUENCIES:

Shuttle II:

Telemetry 144.340 MHz (AX.25 Packet - Plain Text)

ATV 426.250 MHz

Tracking Beacon: 147.555 MHz (CW FM)

HF Net: 7230 kHz LSB + or - QRM

Tracking and Recovery Team: 146.970 MHz Repeater

PURPOSE OF THE FLIGHT:

The purpose of the flight of EOSS 18 will be to test the stabilization
system that was built from scratch by Larry Cerney/N0STZ. Larry has
been diligently developing this system for the past several months.

Since the early days of EOSS, we have searched for ways to slow the
rapidly spinning payload as it ascends and descends through the
atmosphere. Larry has come up with stabilization system that will offer
us better ATV video and also help alleviate some of the stresses that
```

have been put on other components of the balloon payload train. If you
were in attendance at the ground station during the flight of EOSS 17
you may have seen the mock-up of Larry's system.

I have some frequent-flyer freebies that I have to use up by the end of the year on America West.
Anyone recommend any hamfests to go to? I mostly look for test equipment and parts.
Looking for one close to a major metro area (don't want to drive four hours from the airport), and that's a single day affair. Also, it has to be where the airline flys (which is most places except Dixie).
Thanks in advance for your input,
scott nx7u@aol.com

I print my own QSL cards, too. I don't have any fancy graphics on them, but they do look quite professional nevertheless. I print them on post card stock from Paper Direct (1-800-A-PAPERS). Paper Direct has a large variety of multi-colored stock designed to be separated into post cards, and they also have matching business card stock if you want to make your own ham "business" cards. (The post cards come six to an 8.5"x11" sheet; the business cards are 10 per sheet.)

FWIW, I've given them quite a bit of business over the last year or so--both professionally and personally. I've never been disappointed with them.

Herb Duncan (m24501@mwunix.mitre.org) wrote:

: I remember reading somewhere that the term originated when the low-bands
: were popular and some amateur radio antenna builders used to placed a glass
: beverage bottle at the base of a tall vertical radiator as an insulator
: from ground.

Glass bottles work quite well as insulators for vertical antennas - until the wind starts blowing. If the antenna is guyed well enough to stay up in the wind, the force will telescope the neck of the bottle into the bottle and the antenna will come down anyway.

Wine bottles work better than beer bottles because the area around the neck is thicker. I never tried a cushion between the radiator and the bottle to see if that made a difference.

One other thing - I learned the hard way that a vertical made this way without a DC path to ground will transmit like gangbusters, but the corona noise on receive will make your radio essentially useless for about 10 seconds out of every minute. It sounds like a motor starting up at about 3/4 speed for 6 seconds (and about S-6) then 4 seconds at full speed (and S-9+30 dB) then it goes away and the receiver recovers.

[Apologies if this appears twice but the original didn't seem
to make it to the outside world]

Hi,
I recently picked up a Magnetics AB Noise Figure Meter 117A, made in Sweden, from a surplus store at a good price. Unfortunately it only has the plug in for noise tubes.

Missing is the 1177 plug in for the internal noise diode and the 1176 modulator unit for 28V units, which is the plug in I'm most interested in. Given the size of the PCB there can't be too much on it.

Does anyone have any info., schematics or a service manual for the unit, which I understand was quite widely used about five-ten years ago?

Thanks in advance,

Lehane

> so. notes included with the records say this.

> must be more than one Farnsworth?

Nope, it's just that people nowadays _don't_ call the method used by Farnsworth himself "the Farnsworth method".

Quotes excerpted from "Morse Code: The Essential Language"*, Second Edition, by L. Peter Carron Jr., W3DKV, 1991, published by ARRL, box on page 4-3:

"The Farnsworth Method

"The Farnsworth method of code instruction was named after a blind Amateur Radio operator, Donald R. (Russ) Farnsworth, who during his life-time alternately held the amateur calls W9SUV, W6TTB and W0JYC. He was first licensed in the mid 1930's and is a Silent Key today. His method of instruction was devolped during the late 1950's when Farnsworth asked Bart Bartlett, W6OWP, to help him with the preparation of a Morse code teaching course. ...
"Farnsworth's records used code sent at a constant speed of 13 WPM, beginning with simple text which gradually increased in complexity. However, the 13 WPM rate was perfectly sent Morse, using correct element and character spacing. It did not employ the Farnsworth method which bears this man's name today.
"The true origin of the Farnsworth method is still a mystery...."

So, it seems that the method used today is named after Farnsworth, while NOT being the actual method Farnsworth used. Perhaps the method of gradually increasing the complexity of the text was confused in some peoples' minds with the method of gradually decreasing the spacing, or then, perhaps people just wanted to honor Farnsworth without being too uptight about details.

In Ham Radio, as in other fields which lack a defining authority, misnomers and misappellations (sp?) _will_ occur. In the game of Chess, for example, there are openings named after people who wrote _against_ their use (Ponzianni's opening, I believe), and who, if alive today would be indignant over such a pass. This occurs in Math too: Pell had little to do with "Pell's equation".

That's life. :-)

*P.S. No, I will _not_ get into the "Morse Code is a Language" discussion!

P.P.S. This book is a must for the Morse afficionado (sp?)! One of its nice points is the large bibliography.

I disagree. The best thing is for Dad to get HIS license and a 2m HT.
Or get a GMRS ducat which covers the family (assuming you live together).

Enough already with all these schemes to connect other services to
the ARS. If you want to talk to somebody using ham radio, help them get
their ham license.

>Joe Keenan
>
The pure highway route...

GSP North to x161. This puts you on 4 East.
Loop-da-loop at 17 to get on 4 West.

OR GSP South x163 (I believe this is a left exit) to 17 South to 4 West.

NJ 4 West (keep right) to NJ 208 North. Keep trucking to Oakland.
I believe it's the last exit; should hook you into US 202 South.

Talk-in will likely be on 146.49 +1M, and 146.52 should be
good at that point. Look for antennas and ham plates going up 208 ;-).

QST lists start at 9 AM. Go early.

>a service. Anyone know of others? An idea of prices?

The ARRL program often is your best bet.

I have a small business, and got a "marine floater" policy
for my tools, equipment and radios. Any item of over $250
value must be listed on the policy. I put my radios on
the list, at very reasonable costs. This particular policy
covers items in vehicles, job sites or homes.

Don't know if this is useful to you in your case. You might also want
to ask about such coverage as an adjunct to your homeowners insurance.
It's not the much different than fine art or jewelry coverage. The
issues are the cost per $100, the deductible, and claims procedures.

When I took the Technician test here in Houtosn a few weeks ago, I overheard the examiners specifically tell the testees that they (the examiners) would not allow testees to record dots and dashes and then translate them to english text later. It wasn't clear to me whether Gary's method would have been allowed or not.

Seems to me that recording what you hear in "...a shorthand stroke format...." is just another form of writing the "normal" text characters. Further, it seems to me that *any* scheme that allows the operator to get the correct final text down on paper should be allowed (barring replay of the transmitted code). After all, the name of the game is to get the message correct, is it not? If we can do it standing on our heads, writing Chinese characters with our toes, what's wrong with that?

Are the rules governing such practices subject to local options? Is there any kind of uniformity in what practices are allowed/disallowed?

Just wondering.

2737. Workshop On Microwave Technology - Cincinnati, Ohio - September 29-30

Newsgroup: rec.radio.amateur.misc
Date: 1994-08-17 13:00:24 UTC
From: dougee@lerc.nasa.gov
Message-ID: <32t1l8$65d@stimpy.lerc.nasa.gov>
Source record: 261497
Cross-posted to: rec.radio.info,rec.radio.amateur.misc

Workshop on
Microwave Technology 2000 and Beyond

Aim: To provide an in depth overview of some of the major
commercial application areas in Microwave Technology,
to learn the state of art capabilities of defense technology
and to simulate new commercial application areas that can use
this technology. It will also provide a forum for presenting
our present work in related areas.

When: September 29-30 , 1994.

Place: University of Cincinnati, 402 Tangeman Center, Cincinnati, Ohio

Organized by: Ohio Aerospace Institute, Microwave Technology Technet.

Participating Organizations: IEEE Cincinnati, Dayton and Cleveland Sections,
University of Cincinnati.

Invited Lectures: Experts are invited to give presentations on some of the
important emerging application areas related to microwave technology.

Program:

September 29, 1994, Thursday
9:00-11:00 Invited Talks
- Microwave an Millimeter Wave Development at NASA LeRC (G.E. Ponchak)
- Cellular Communication Systems (P.Odlynsko, Motorola)
- Microwave and Millimetric Wave Photonic Technology (B Hendricksen.
ARPA, Rome Lab.)
12:00-1:00 p.m. Lunch
1:00-3:00 Invited Talks
- Microwave Integrated Circuit Technology (M. Calcatera, WPAFB)
- Industrial Applications of Microwaves (A.M.Ferendeci, UC)
3:00-5:00 p.m. Contributed Papers

September 30, 1994, Friday
9:00-12:00 Invited Talks
- Microwave Applications in Medicine (L.Taylor, Univ. MD)
- Technology Transfer To and From Radar (M. Skolnik, NRL)
- Intelligent Vehicle Highway Systems (R.Dixit, TRW)
12:00-1:00 p.m. Lunch
2:00-3:30 Panel Discussion

Microwave Technology: Defense to Industry Transition.
Moderator: D.Connolly, NASA LeRC.

Contributed Paper Presentation:
Short papers (not to exceed 10 min) will be accepted for presentation during the workshop to provide the ongoing research and development activity related to the commercial and industrial applications of Microwave Technology. Papers especially related to microwave sensors, medical applications, industrial applications, IVHS, photonics at millimeter wavelengths, material characterization, measurement technology and high power commercial applications are encouraged. Proceedings of the workshop will be available for distribution during the workshop. Please send an abstract not to exceed 250 words to Altan M. Ferendeci, ECE Dept. University of Cincinnati, Cincinnati, Ohio 45221-0030. Fax: (513) 556-7326. Deadline for receipt of abstracts is Sept. 12, 1994.

Hotel Reservations: Rooms are reserved for the workshop at Vernon Manor Hotel, 400 Oak St. near the University. Please call 1-800-543-3999 or 1-513-281-3300 and mention UC Microwave Workshop. Please register before Sept.14,1994.

Registration: In advance (before Sept 15, 1994).

>up with some banal comment or something.

Ah, but you *can* remain silent if you have nothing to contribute. That happens all the time on our repeater. We may have a dozen stations in QSO, and none may have anything of interest to say at a particular moment, so we all remain silent. Sooner or later, someone will have something to say and conversation will pick back up hot and heavy. We eschew strict rotation format because that does tend to lead to banal comments and stilted conversation. We call ourselves purely interrupt driven. That can sometimes lead to incredible doubles and triples, but that's OK, it quickly sorts itself out and discussions remain lively.

>Obviously, this phenomena is less of a problem when there
>is an actual purpose to the QSO (like a contest or something).

Well of course contests remove the problem by removing the necessity of having *content* in the conversation. It's just a meaningless formalized exchange, over quickly, and on to the next station so the same contentless exchange can be repeated ad infinitum, ad nauesam. It has nothing whatsoever to do with conversation or with conveying ideas from one person to another. For those with nothing intelligent to say, it does offer an excuse to generate RF.

Many amateurs appear not to have good conversational skills in any event, and many contacts are repetitive and boring. If most amateurs had good social skills, they might not have gravitated to amateur radio in the first place. Amateur radio has a disproportionate number of geeks and loners. (The most common comment made by the shocked neighbors to the news media is "He was such a quiet boy.") But if you can get somebody to talk about something that really interests them, they'll talk your ear off. The key to conversation is the ability to

listen to what the other person is really saying, and to respond appropriately with either your own ideas, or with questions. You'll be surprised how easy conversation can be when you actually have something meaningful to say.

Gary

Good observation. It's especially difficult when you're just starting out.
My son (who's 12) and I received our tickets about 2 months ago, and the
first time we got to use the airwaves was on a trip to the west coast. My
son did most of the radio work, and it was very frustrating for him at
first because after a conversation was started, the person he was talking
to would make some insignificant comment, then stop. My son would ask
"What should I say?" He felt he should respond immediately, but couldn't
think of what to say. I "coached" him quite a bit, and now he gets along
pretty well. It takes a little thinking ahead so that you can say
something, even if it changes the subject. If you =really= have
nothing to say, it's time to say 73 and sign off. ;-)

>

Therein is the problem with most 'rag-chewing' and why I don't generally
do much of it (actually, I don't do much operating at all anymore).
When I was more active on the air, I found it useful to ask questions
such as "what other interests do you have besides ham radio.
What do you do for a living. What aspects of ham radio to you particularly
enjoy" etc. An open ended question can frequently spark a lively and
enjoyable conversation; On a few occasions, I've been in contact with
someone and have had several other people ask to join in. I suspect it
goes without saying that politics and religion may not be the
best topics.

If you find that you have nothing to talk about, why continue the conversation?
I suspect it is because no one wants to offend the other party by terminating
the contact. I don't know about other hams but I don't find it the least
bit offensive if the other operator let's me know that he'd like to go
see what else is happening on the band ... in a few cases I've been relieved
that the contact is drawing to a close!

73 es happy QSOing,
Tom

2741. ARRL Educational Workshop - EMI and the Radio Amateur

Newsgroup: rec.radio.amateur.misc
Date: 1994-08-17 13:58:20 UTC
From: ehare@arrl.org
Message-ID: <1994Aug17.135820.14852@arrl.org>
Source record: 261492

The ARRL Educational Activities Department is sponsoring a 6-hour Educational Workshop, "Electromagnetic Interference and the Radio Amateur," Friday, August 26, 1994, 9:00 - 4:00 at the ARRL SW Division Convention, Town and Country Recreational Center, San Diego, CA. (The course will be repeated at the New England Division Convention on September 30.)

This course will be taught by Ed Hare, KA1CV, ARRL Laboratory Supervisor and co-editor of the ARRL book, "Radio Frequency Interference -- How to Find It and Fix It." Those who attend the entire workshop and turn in an evaluation form can receive 0.6 Continuing Education Units. The cost of the course is $10.00 for ARRL Members, $15.00 for others, to cover the cost of the printing of course materials.

This course, designed to help radio operators, their neighbors and others, covers most aspects of EMI and EMC problems, ranging from a morning of interpersonal aspects and technical theory through an afternoon of practical solutions. The course doesn't use complex math or cover EMC engineering, but concentrates on off-the-shelf, practical solutions to most EMC problems.

Outline:

EMC Fundamentals
EMC Regulations
Personal Aspects of EMC Problems
Sources of Help
Solutions for:
Audio Automotive Transmitters
Computers Television Intermodulation
Telephone Power lines More!

To attend the San Diego course, pre-register by contacting Sybil Allbright, W6GIG, at 619-278-4284, or call the ARRL Educational Activities Department at 800-326-3942. Contact the ARRL about the New England course.

(Do NOT reply by email to the poster; I will be on vacation starting Friday!)

Yep, otherwise the other ham might think:
A. The path collapsed (HF QSB)
B. You fell asleep
C. One of the xcvrs drifted off-frequency
D. His SWR exceeded cut-off limits
E. You are slurping a cuppa coffee or took a potty break
F. (if on a repeater) The repeater timed out
G. (if mobile) The friendly traffic cop distracted you

> Obviously, this phenomena is less of a problem when there
> is an actual purpose to the QSO

Alas, bidirectional information exchange is all too rarely the purpose
of a QSO. You might find that use of VOX and a group QSO reduces the
severity of this phenomenon somewhat. The VOX helps fill in
conversational pauses with coughs and background noise such as dog
barks and flatulent outbursts.

> a linguistics course, and we will be studying 'conversation
> analysis' in a few weeks. I'll report back if I find any
> theoretical foundation for this type of conversation anomaly.

Tongue-in-cheek mode OFF: My guess is this originated in the
time-limited characteristics of HF QSOs. Each party wants to say as
much as he/she can before QSB, QRM or QRN affects the signal. Maybe
this is a biological method of speech compression?

In <portnoyCuAxH5.A21@netcom.com> portnoy@netcom.com (Elan Portnoy) writes:

>I'm a US amateur that may spend a year or so in the UK.
>I'm not familiar with the necesities for obtaining permission.

Hello,

Having just gone through the process for the UK I can give you some advice.

There are two types of temporary license, a two month one where no fixed address is given, i.e. mobile during a holiday (US translation: Vacation Trip) and a twelve month one where a main station address is supplied, i.e. long stay. Neither license is renewable and no UK call is assigned.
If you are a US ham then you need a Conditional/General License or above.

A few years ago I would have suggested getting the forms from the ARRL. I appeciated the service so I joined ARRL for a few years. However this year I rang up and was told after the person found out that I was not an ARRL member that providing the forms is "a ARRL Member Service and members get upset if non-members get it for free". I was allowed to send a SASE to the league and get the information so they saved 29 cents in postage and lost a year's worth of dues. It is a wonder members do not complain about non-members accessing ARRL's info server. So if you are not a ARRL member then expect some flack and if the ARRL is in a good mood maybe you can send in a SASE. Otherwise go to the RA or RSGB.

The application has the address and information you need. The main problem is that you need a 15 pound fee as either a British Cheque, British Postal Order, or International Money Order. The easiest way is if you have a friend in the UK to send the application to him and have him send a check with the remailed application. The next cheapest is to send an international money order. The problem is that a international money order is issued by paying the fee at the local post office and sending a application to Saint Louis where the International Money Order is issued. I have run into numerous problems with this method as the application and money order do not seem to arrive at the same time. The most expensive is to go to a bank and get a International Banker's Draft in Pounds Sterling.

To dial the following numbers in the US: dial the international access code, usually 011, followed by the Country Code for the UK, 44, then the number given without the leading zero. So (0272) 258333 would be dialed as 011+44+272+258333.

The Radiocommunications Agency regulates amateur radio in the UK, but the issuing of licenses is handle by a private contractor. So you send the application to:

The Radio Licensing Centre
SSL
P.O. Box 884
Bristol BS99 5LF
England

The telephone is (0272) 258333

You could get the application from the RA. Here is the infomation I have:

Amateur Radio Licensing Section
Radiocommunications Agency
Waterloo Bridge House
Waterloo Road
London SE1 8UA
England

The telephone is (071) 215-2217 -or- (071) 215-2316 (answerphone)

RSGB info:

RSGB
Lambda House
Cranborne Road
Potters Bar, Herts EN6 3JE
England

Telephone (0707) 659015 Fax (0707) 645105

I contacted my Farmers Insurance agent. We have two cars
on the same policy. I told him I wanted our cell phones
(portables that may or may not be left in the glove
compartment) and any mobile or portable amateur radio
gear that might be left in the car to be insured against
theft. For only and additional $15.00 per vehicle per
6 months, it was added to our policy.

2746. Where can I find RG-302 & RG-303 ?

Newsgroup: rec.radio.amateur.misc
Date: 1994-08-17 14:53:52 UTC
From: Tom WB7ASR <tom_boza@ccm.hf.intel.com>
Message-ID: <32t97o$h80@chnews.intel.com>
Source record: 261487
Cross-posted to: sci.electronics,rec.radio.swap,rec.radio.amateur.swap,rec.radio.amateur.space,rec.radio.amateur.misc,rec.radio.amateur.homebrew,rec.radio.amateur.equipment,rec.radio.amateur.antenna

Im rebuilding the phaseing delay lines for my KLM amateur satellite yagis and need to located a source to acquire about ten feet of RG-302 75 ohms and ten feet of RG-303 50 ohms, teflon coax cable.

RG-302 & RG-303 both have teflon dielectric and a silvered copper shield, both have inner conductors of silver-plated copper-plated steel. They are designed for high-temperature operation. I suspect they were selected by the antenna manufacturer because of low temperature coefficients. I don't want to use Radio Shack 75 ohm TV cable.

Different velocity factors between teflon and polyethylene.

polyethylene = 66.5% teflon = 69%

KLM sells the complete phaseing kit replacements for $49 each, however I feel I should be able to replace just the coax for at least half that price.

If anyone knows of a source for RG-302 & RG-303, please post here or reply via eMAIL direct.

Thanks and 73s,
Tom - WB7ASR... (not speaking for Intel)

First, Venkat, go to your nearest Radio Shack store and buy a copy of "Now You're Talking" which is a good introduction to ham radio and a study guide for both the Novice and Technician class licenses. Ask at the same place if they know of any hams who like to help newbies. These folks are called "Elmers" or "Elmiras" (yes, there are at least four or five female hams in the world, and they generally know a lot). Stay tuned to this newsgroup, and to the other rec.radio.amateur groups. There are lots of other resources as well; use these as a guide into the others. It's an interesting hobby, and has some nice real-world applications as well, for example in disaster communication. Good luck.

>Any help would be greatly appreciated.
>

I have no experience with this radio myself but can give you some
second hand information from a mail list discussion:

This is a fairly early HF all solid-state radio. Probably built in
mid to late 1970's.

Drake equipment is generally quite good and all the comments on this
unit were favorable. It was built before synthesizers, so it is all
analog.

The radio tunes in 500kHz segments and needs a crystal for each segment.
You should ask what crystals the unit has. There was also an outboard
accessory available that replaced the crystals and allowed tuning
all segments.

It should tune up to 30MHz if you have the right crystals for it.

I am not sure exactly what kind of filtering it used; ask about
filters that it has. It is important to have the right filter
for the type of signal you want to receive.

Prices mentioned were in the US$200 - US$300 range.

Well folks, I called the DB of TN last night... Sure 'nuff, there was lots of clipart in the ART file library and the HAM-# libraries are definitely worth another long distance call! The only problem is, the ham clip art files listed are, I believe, from someone or something at ARRL. All four files have the same clips and to be honest, these clips are pretty lame. They actually defy description... they are in PCX format, which is just dandy, but these clips are most definitely not something you would want to put on a QSL card... oh well, the search continues... Still looking for clip art, or any art binaries that might be amenable to QSL card design.

BTW, Tim, nice BBS... I enjoyed using it and like the ease with which I was able to figure out the file search stuff and get on about my business as quickly as possible, instead of trying to figure out how to get to the files for an hour.

2751. Amateurs on USENET List ending at end of month :-(.

Newsgroup: rec.radio.amateur.misc
Date: 1994-08-17 15:57:13 UTC
From: mark@ve6mgs.ampr.org
Message-ID: <1994Aug17.155713.21146@ve6mgs.ampr.org>
Source record: 261494

Due to a personal dilemma beyond my control, I must terminate my activities associated with the Amateurs on USENET email list. I will continue to let the email server function for lookups. I will be posting the entire list at the end of the month, rather than the current `update' posting (unless a volunteer can be found).

If someone wants to volunteer to take over the list, I'd recommend that they have *good* administrative access to a UNIX machine running Cnews, but do not necessarily have to be on a mainstream site (The list was maintained for three years on a 68000 running V7 UNIX three UUCP hops off an Internet host). I have written many automated tools, mainly written using shell scripts using awk, sed, grep and /usr/lib/spell (for part of the database). I spend an average of about 10 minutes/day performing duties centered around the list (currently backed down to 3 minutes/day now that the news tracking software for identifying new addresses is turned off) and requires constant vigilance or the duties add up, as I often hold off for a week and spend an hour on the weekend.

I have appreciated the helpful comments over the past four years from many well wishers and people and their friends that have benefited from the information on the list. I feel that this service I have provided has been a useful part of the rec.ham-radio/rec.radio.amateur community. It would be a shame to see it disappear into history ...

A replacement moderator for rec.radio.info is also being sought, but currently discussions are already on with a prospective volunteer. I appologise for any inconveniences my speedy resignation to these two duties will create.

The FCC database which the CDROMs are cut from does not include
club call signs. While this might be changing, as of 1993 the FCC
kept club call signs on paper index cards.... Why do you think
they didn't issue new ones?

Gee, Nils, aren't you soooooo *special?* Gosh, you are so cool... gee can I hang out with you?

(Ok, there's the flame you requested... did you enjoy it?)

Actually, I don't have a use for the "professional" cards... I don't do enough HF or DX to warrant that.... every now and then, however, I will want to QSL with someone, but I don't see the need to spend big bucks on QSL cards (Yeah, I know, most print shops have budget cards where you can get 200 cards for about $15 or so, but what am I gonna do with the 195 cards I have left with the wrong address on 'em when I graduate and move away from here?)

Anyway, dunno why I felt the need to justify something like this... guess I felt more like explaining that to someone as special and *modest* as Nils.

Yeah. I have one sitting right here Paul. I don't have to use the metal ring. Personally, I prefer to manually hold the PTT. The mic works fine with VOX without having to use the ring also.

I do use the ring for one thing, that is to set the PTT sensitivity. If the ring is all the way to the base, you get great wrist exercise and sore muscles in a long winded QSO. If you set the ring to the top, at the threshold of keying up, you can almost get the radio to key by throwing a feather at the PTT bar. :)

> It is routinely called, "The 75M death grip."

I didn't know that one. But, I can see why. hahahaha haha ha.

There are some good aspects of this conversation envirnment, like that
noone can "barge in and grab the floor" untill you are done transmitting.
I've had problems in regular "face to face" "in person" conversations
with people starting to talk before I get done with my sentence.
That can't happen in a "when you transmit, you cannot hear" system.
Thus you won't shut up someone tries to barge in, and a third person
listening will just hear an untellagible mess when we "double" transmit.
Nowdays, in "face to face", I'll keep talking untill I finish my thought
when someone tries to interrupt. (I was youngest in my family, if that
might explain this problem).

>Comments anyone?

I did notice how much the subject line on this posting makes it look like
a packet message.

I have noticed that many amateurs speak way too close to the mic so that
you can hear their heavy breathing and other animal noises.

I have noticed that hams who use colorful euphemisms like "hi hi" and "QSL"
seem to have the least interesting conversations.

I have noticed that packet backbones seem to have taken over almost all the
222 Mhz voice simplex channels.

I have noticed that the average content of rec.radio.amateur.misc has changed.

Nope. Not legal. As an alternative why not use alt.cascades? Makes about
as much sense as the !@#$ you hear on most 11m frequencies, well, around here
anyway!

Hi there,
Some time ago I read something about the possibility of reaching the
packet radio network in the US through an Internet gateway.

Does someone knows this gateway? How to reach/address??

Thanks....Paul(PA3APA)

2764. QSL route? for GJ3ULT

Newsgroup: rec.radio.amateur.misc
Date: 1994-08-17 20:43:03 UTC
From: dara@physics.att.com
Message-ID: <Cup5Js.HKy@nntpa.cb.att.com>
Source record: 261509

Months ago I worked GJ3ULT. There's no callbook listing but it
was suggested that I try sending it to G3ULT who holds the only
call with "ULT" and might also be GJ3ULT. Unfortunately, there
was no response to my qsl and postage. Any other suggestions
from the UK?
tnx Shel WA2UBK dara@physics.att.com

2765. Yaesu FT530 vs Icom W21AT - A summary of opinions

Newsgroup: rec.radio.amateur.misc
Date: 1994-08-17 21:06:02 UTC
From: chennu@ichips.intel.com
Message-ID: <CHENNU.94Aug17140602@pdxcs070.ichips.intel.com>
Source record: 261512

My original post was

In article <CHENNU.94Aug15131245@pdxcs037.ichips.intel.com> you wrote:
: Hi,
: As the subject says I am considering purchasing a dual-bander HT.
: I would like to get the opinions of those who have used them.
: Any recommendations would hbe welcome too.
: HRO has the Yaesu for 449.95 & the Icom for 434.95

Here are all the responses I got

From George Guillory, KC5HBT
guillory@blkbox.com

I investigated both before my purchase of a W21AT.
I used several (including the Yaesu) that other people owned at
local ham club meeting. While most people owned others the only
gripe they had about the W21at was that it looked weired. (Too modern
for them I guess.) They never griped about performance.

Some things I like about my W21AT:
I like the fact it is also a general coverage receiver all the way
up to 900mhz. Several of my favorite "cop" frequencies are in it as
well as the relay of the local radio news channel to its tranmitter
tower.

I like the fact that you can buy the optional "empty" battery case
the BP-130. With this case you can load up your own ni-cads or
alkaline batteries. This allows you to buy a nicad charger cheaper
than you can buy ICOM's very expensive charger.

I like the ability to put the W21AT in a mini-repeater mode.

I like the smaller size. Other brands are not far behind but the
smaller the radio is the more likely you are to carry it.

I like the ability to use "wisper"mode. Although I havn't used it
yet.

You can alway call 1-800-USA-ICOM and talk to a tech rep anytime. They
will even answer stupid questions!

Mine one grip: It uses a special &^$%#&!! power cord! The plug (which
is only available from ICOM) on a pigtail is $14! I do like
the special filtered cigarette power cord though for $24.

I say buy the one the guy offers you!

##

From Randy Petersen
KE6IZZ
drp@netcom.com
I have the Icom W2A which is very similar. It is 2meter and 70cm.
It has extended receive of 108 to 174 and 300 to 500, with a
UHF hi of 800 to about 900 mhz. It can be modified to transmit
on CAPS and MARS frequencies Marine etc. Great HT. HRO is closing
out for about $390. I would recommend highly.

##

From Dick Kriss, kd5vu
I shopped the HT's and purchased the FT-530 and it is the BEST
radio I have every owned. Too bad Yaesu does not make a mobile
rig with the FT-530 features.

I have owed Icoms (not the w21at but others). Check the 4-Sale
ads....you will see all kinds of Icoms up 4-
Sale and never see a FT-530 for sale. Think about it!

##
From Doug Hamilton KD1UJ hamilton@bix.com

Until recently, it certainly looked like the Yaesu FT-530 was the one
to beat. But I think if I were going to buy a dual-bander today, (and
indeed, I have been thinking about it :-) I think I'd go with the new
Kenwood TH-79A. Frankly, the alphanumeric display, which lets you
program in names for the frequencies in the memories looks like a
real winner. Too, I think I've always thought the Kenwoods have had
somewhat nicer cosmetic design. Price of a 79A should be in the same
ballpark (maybe +$25) as the other units you're considering if you
shop carefully.

##

From Ken Nishimura
Shop around -- check out the mail order joints. $450 for the 530
is WAY too much.

==ken
##

From gianotti@aol.com

have both radios . . . and the ICOM is up for sale! The ICOM looks
nicer than the 530 but that is all. The ICOM has terrible audio on
receive (due to the lack of speaker), the buttons are too small to hit one
and a time, the display is poor in good light and worse even with the
built-in night light, the small antenna is next to a dummy load.

The 530, to my mind, is a much better radio, while it may not look as
sexy, it is much more user friendly to use and program.

73

##

And poor ole me is as confused as ever. :-) However I am definitely
leaning
towards the FT530.

Thank you one & all for youe helpful input

Srinivas

From: brian@umbc.edu
Message-ID: <32u125INN4a3@umbc7.umbc.edu>
Source record: 261510
Cross-posted to: rec.radio.amateur.misc,sci.space.shuttle

Is anyone aware of any HAM TV retransmission of the NASA Select video in the Baltimore/Washington area. The sleazy cable TV operator (Comcast of Howard county, MD) can't seem to find the bandwidth for NASA Select. (Of course they do have four PPV channels and a 24-hour a day barker channel!)

PS: If anyone has had success in receiving ATV by tuning a cable-ready TV to the "right" channel, please let me know.

Thanks,

73's

Brian

I appreciate all of the responses. I found that the simplest way to fix it
was to replace them with battery operated detectors. No ac wiring so no
antenna. It did the job and was really the quickest and cheapest way. These
detectors are only 7-8 dollars each at the discount stores. You should have
one anyplace that could be dangerous.
I realize that the battery could go down but the ac power could go off too.
I think that batteries are better. I have always had battery ones and the
warning they give by chirping as the battery gets low has always been
sufficient for me.

In the SF Bay area an ATV repeater retransmits some of the flight(s) as
time permits. One ATV/R output is on CABLE channel 58 and the other is
om 2.4 Ghz.

It can be done!

Best of luck.

Tom Bodoh (bodoh@dgg.cr.usgs.gov) wrote:

: Can anyone comment on the 'Code Quick' code tapes that claim to
: be a revolution in learning code? Are they worthwhile and as good as they
: claim?

I think the claims are an understatment. :-)

I have been trying to learn code since 1965. I was never able to
do it. I tried many methods including high speed code, low speed code,
hypnosis tapes, computer programs, etc. No success.

Got the tapes in mid April, passed 5wpm with 100% of the questions and over
2 minutes of perfect copy on July 7.

My son was copying 100% at 4 wpm in one month at and keeps getting
better every day.

He also went from fighting any attempt to make him study to liking the code.
He now (using the Code Quick Plus+ program) studies on his own.

:This is the one that says that they send the information to the
: language center of your brain (I hope they include the cables ;-). Thanks...

The cables are not needed, just a pair of headphones, a tape recorder,
and about 1/2 an hour a day. Extra time spent listening to W1AW and
sending practice help too, but it won't seem that way until you are
done the course.

The computer program, Code Quick Plus+, helps too, but it does not
replace the tapes.

Since I have been asked several times in the last few days for where to
get it, here's their address:

Congrats Mike on you achievemnet. I wish for you a happy and enjoyable "ham-life".

One of our folks received his in just a few days over five weeks ... Yes, I said 5 weeks! Don't know if it was a fluke or if things are speeding up, but he sure is happy.

Hope the wait will be short for you as well.

Well Paul, I hope you get to read this. I have been waiting excitedly for about ten days for Terman's book to arrive. I thought that maybe you were waiting for the check to clear, maybe mail transfer from Canada to the U.S. is slow, I just didn't know. But you know why the book never made it don't you? It's because you never got the money!!!

I know this because I got the letter back today for INSUFFICIENT POSTAGE! It is postmarked Aug 9, 1994. Just another aspect of the U.S. snail.

I will take the letter to the post office tomorrow to maKE sure that I get it r right this time. Also, sorry for posting here, but I have lost your e-mail address. I would really appreciate it if you would send it to me again...

Thanks for your patience, and sorry for the mix up,

Dan Kline <t230579@univscvm.csd.scarolina.edu>

>
> Mark
> --
>
> Mark
>
> mark@inviso.com

It is a good receiver. It is, however, broad and quite suceptable to intermod interference. If the packet node has reasonable strength (50% or so quieting), you should be OK.

Usually, packet nodes do not use CTCSS. Ask the owner/operator to be sure.

Crystals are available from the crystal manufacturers. Don't go looking for the "cheap" crystals .... shell out a few bucks and get crystals made specifically for the HR-2A. I'm sure you can find a supplier, but if you can't, E-Mail me and I'll get you an address of one in Northern KY.

Good luck on your project!

2781. Why Some people hate Wayne Green

Newsgroup: rec.radio.amateur.misc
Date: 1994-08-18 00:34:01 UTC
From: dphillips@ws07.iac.honeywell.com
Message-ID: <32ua9p$m0n@adm09.iac.honeywell.com>
Source record: 261356

Seems like there are alot of people out there who just don't like
Wayne Green. Some have even cancelled their subscriptions to 73 due
to his "homophobic blathering" within its pages.

Well, I guess these people probably wouldn't have liked Abe Lincoln,
Franklin Rosevelt or Abby Hoffman either. Heck, I don't particularly
like the guy, but then again, I don't have to read his collumn either
to enjoy the magazine.

The fundamental rule of journalism is to write something that is
of interest to a sufficient number of people in order to sell a sufficient
number of copies to make a profit. Wayne seems to be doing very well in this
regard with all of his many publications.

Some people just can't take a joke.

2783. Kenwood TM-733A undocumented functions.

Newsgroup: rec.radio.amateur.misc
Date: 1994-08-18 00:44:51 UTC
From: steve@vigra.com
Message-ID: <STEVE.94Aug17174451@susie.vigra.com>
Source record: 261529
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.misc

I just talked to Kenwood and found out a few new things about the
TM-733A. I haven't tried most of these yet (because my radio is all
taken apart), but I'll pass the info along.

////
The extended range modification:
They *do* have an official extended range modification, but they will
not send it to you unless you first send them proof of MARS or CAP
enrollment. I tried to explain to them that I want to transmit into
the hamsats at 435 MHz, but they didn't care.

////
The official word on the dirty CTCSS tones is that it's still an
unknown problem, and there is no Service Bulletin to correct it. If
enough people notices the grunge in the outgoing tone and call them
about it, maybe they will check into it.

////
The partially-documented "External Remote Control Operation" is
documented in App Note AAN-0006. Some people have found that when
remote control is enabled, the microphone is hot and will hear DTMF
tones coming from the speaker if the volume is turned up and the mic
is near.

To remote-control the radio with the microphone disconnected (yeah!),
they offer this procedure:
- Pick a UHF control frequency.
- Turn on the UHF DTSS function and select a tone sequence.
- Turn the UHF DTSS function back off.
- Press Band Select to move to the VHF band.
- Turn OFF the radio, press and hold the [CONT SEL] key, turn on the
radio, and then release the cont key. This will place you in the
EXT standby mode. The S-meter scale and the DT indicators for the UHF
band will begin flashing ON and OFF. The LOCK indicator will turn ON,
and most front-panel keys (PWR stays) will be disabled.
- To begin remote control, you should key the external radio and
press the following key sequence: "Axxx#" where "xxx" is the preset
DTSS code selected earlier.
- If the proper code is received by the 733, the beeper will sound and
the "DT" indicator will stop flashing. The radio can now be
remote-controlled, using the function chart in the manual (p. 81?).
- The return to standby mode, press "A#" on the remote radio.
- To return the radio to normal operation, turn the radio off, then
press and hold [CONT SEL] while turning the radio back on. Repeat

one more time. (really!)

Wow! I would have never figured this out on my own. I was beginning to think that the acoustic-coupled mic/speaker was the only way to remote control it.

My reading of the instructions is that it starts off the remote control mode "locked", which is a good idea. You can then unlock and relock it with the DTMF code sequence. Pretty cool.

////
The advertised but undocumented Wireless Clone function is described in App Note AAN-0008 which they will mail out on request. (Maybe if enough people ask for it, they will include all the functions in future instruction manuals.) In summary:
- Prepare the two radios for simplex operation on the same frequency.
- Turn both radios off
- Press [CALL]+[SHIFT] + [Pwr On].
- This should place the radios is clone mode with "CLonE" on the display.
- Press PTT on the "Master" radio momentarily. This will start sending the programming DTMF tones.
- After all data has been transferred, the display of all radios will read "End", indicating success.
- If the signal is interrupted or corrupted, the "Slave" displays will read "Err". Turn them off and try again.
Notes:
- Both the Master and Slave radios must have the same number of memory channels available for each band. Example: You can not clone a stock Master to a Slave with ME-1 memory expantion.
- You can not clone between different Kenwood radio models, even if they seem identical.

////
The advertised but undocumented cross-band repeat function is described in App Note ANN-0009. Most people have already figured this one out.

Basically, you set up the VHF and UHF bands, then select the "X" icon from the [F](for 1 second) menu. For bi-directional repeater operation, make sure the PTT and Control bands are different, usually by pressing Cont Sel once. If the PTT and Control indicator are on the same side, then it will only retransmit the other band to that side (for one-way extender operation). All the decimal points will light up when in repeater mode. The remote control sequence to turn on/off repeater mode is "DC".

The transmitter hang time can be toggled between 500ms to 0ms by turning on the radio with [LOW] pressed. They also recommend enabling the Time-out Timer, for obvious reasons.

////
The "Assembly Mode" for testing the control panel indicators, buttons,

and knobs is documented only in the Service Manual. I posted a summary a few days ago.

////
So, there you have it! When I get the mods all figured out and tested, I'll try to post a full report with details on all the undocumented features and the mods. This should end up in the archives somewhere.

Happy Hacking!
-Steve

: >signal but you'd be able to find where someone is on demand (if they're
: >within cellular calling range). Such a setup could last for a LONG
: >time with the proper battery.

: You aren't going to be able to get a GPS and cell phone for a couple
: hundred dollars. The cheapest GPS receivers are around $400, and so
: are cell phones unless you roll their cost into a long term service
: contract. And monthly and per minute cell phone charges will mount
: up fairly rapidly. By using packet radio, amateur or commercial,
: you can send position updates on a regular basis without incurring
: quite as much cost.

: DeLorme Mapping and City Streets are a couple of commercial map
: systems that work with GPS. However, APRS (Automatic Packet Reporting
: System) is in some ways better. While it lacks the friendly user
: interface of the commercial products, and it's pre-made map databases
: are skimpy, you can make your own maps, and it works with local and
: remote GPS receivers (using packet UI frames for the latter). It also
: supports other information about the remote sites such as range and
: bearing data from DF equipment, and arbitary text messages.

: However, what many of us want is *differential* GPS. The Coast Guard,
: FAA, and others send out position deltas from a fixed benchmark
: receiver that are received and used to correct the reading of the local
: GPS receiver. These transmissions are either at MF or VHF depending on
: the system. A special receiver is required, and either a GPS receiver
: designed to work with differential signals, or a PC that can take the
: timestamped position reports and reconcile them via software, is used
: to give a true position. This method removes the deliberate SA jitter,

: and other error sources such as varying atmospheric propagation factors,
: from the position data. This allows much greater precision in determining
: location than raw GPS alone.

: It would be nice if the APRS author would support this mode in his
: software. Some of us are willing to set up benchmark receivers on
: the amateur bands. That timestamped data could be used to correct
: the positions reported by the rover receivers over packet.

: Gary

: Lawrenceville, GA 30244 | | gary@ke4zv.atl.ga.us

This has already been done on an experimental basis here in the Annaoplis
area: A cooperating ham otransmits a differential signal on the same
freq as the APRS net. Receive it thru your TNC and it goes into the
GPS receiver. Works fine.

dara@physics.att.com (Shel Darack) asks:

>>Months ago I worked GJ3ULT. There's no callbook listing but it
>>was suggested that I try sending it to G3ULT who holds the only
>>call with "ULT" and might also be GJ3ULT. Unfortunately, there
>>was no response to my qsl and postage. Any other suggestions
>>from the UK?

I don't know anything about this particular person, but you
did the right thing. The Gs issue calls in order, regardless
of the prefix, so if I operated from Wales I would sign GW3NMX
without any ambiguity. In Jersey I would be GJ3NMX and so on.

I worked GJ3ULT in the Feb 94 ARRL-cw contest (40m), so it sounds
as if you have the call right. If that is when you worked this
station, there really hasn't been enough of a time delay to worry
yet. It can easily take 6 months to get cards printed and face
answering the requests, considering that right after an intensive
contest the last thing you want to do is think about that aspect
of things.

Back when I was studying for my Tech ticket, I used a shareware software program (for MS-DOS) which contained the entire FCC exam pool and would create sample exams from the pool for the various elements. I think the program was called "HAMPOOLS", or something like that. I must have deleted the program because it's nowhere to be found on my disk, and in any event, I think the questions have changed since then.

Does anyone know where I can obtain this program, or another shareware program like it, either via FTP on Internet or Fidonet FREQ? (I'd prefer a direct reply via email, but you can also post it to this newsgroup since I'm sure others would be interested, too.)

Note that these "extra features" come with the caveat that Kenwood doesn't officially support them--it's caveat emptor.

We bought three '733A's for the ham club here at work, and I've tried the clone function. Bad news: while the memories seem to clone okay, the process causes both the master and slave radios' VFO modes to go into outer space--like instead of being limited to tuning the VHF side to below 180 MHz, the VFO can only tune *above* 180 MHz--not too useful when I'm trying to dial in 2M frequencies.

I tried two or three times to clone a "good" radio to a slave, and ended up with the same ill-effects--which required a master reset to recover from.

There are two problems with that idea, one for each direction of the link.
Well, two legal problems, you might also have some political problems with
local amateurs :-)

First, if you linked the amateur receiver to the 11m transmit, your will
have to set up the CB radio to automatically transmit when audio is received
on the amateur receiver, and would then be in violation of 95.419(a), which
prohibits radio remote control of a CB radio.

Second, if you linked the CB receiver output to the amateur transmit on the
repeater, you would be in violation of 97.113(e), which prohibits retransmitting
communications from non-amateur stations (there are some exceptions but CB is
not included).

The method of passing the test by transcribing the dots and dashes and
then transliterating them into letters during the time allotted for
"correcting" your text is _specifically_reccommended_ by Wayne Green in
one of his editorials this year. I don't have the issue handy, but it
was sometime around May or June. I don't see anything wrong with using
this technique, if possible, during an actual QSO, but it certainly
seems to me to be wrong to do so during the exam. The reason I think
this method is cheating is _not_ because I'm a priori against any _particular_
means of getting the correct answer onto paper. Rather, it seems to me
that this method depends implicitly on misusing that portion of the
exam time which is supposed to be used for correcting relatively straight-
forward errors, and, IMHO, _not_ to be used to perform some intermediate
transliteration step.
After all, if we take the argument to an extreme, why not simply take a
tape recorder to the exam, record the test, then play it back real slow so
you can translate it to plain english? After all, making a magnetic
intermediate impression on a ferrous-oxide-coated plastic strip is just
an extension of technology in the tradition Morse himself started, isn't
it? How can it possibly be worse than using a typewriter?
:-)
[deletions...]

Yeah, I'm curious about this too.

-tentarelli k.d. (g8@mvuss.mv.att.com) wrote:

: Does Communications Quarterly have a particular focus ...contesting,
: build-it project, DXing, etc. ?

There are plenty of magazines covering contesting and DX'ing. They
don't seem to have any problem finding enough material.

The US magazine "Ham Radio" was a playground for the more
technically adventurous. It had no interest in contests, DX'ing etc.
This magazine was shut down shortly after being taken over by the
publishers of CQ. These same publishers, a little later, started
"Communications Quarterly" (note the initials) Opinions vary, but it
is not really as good as what it replaced, some authors have gone.
"Ham Radio" was not really a mainstream magazine, it appealed to builders
not buyers, so the Japanese radio marketeers saw it as infertile ground
for their advertising budgets. Component and surplus dealers don't have
advertising budgets even in the same league. Most amateurs saw it as
"too technical" for them and opted for easier reading. It may be that
there is insufficient market to safely support such a magazine. At least
the operators of "Communications Quarterly" and QEX have other
enterprises which will allow them, should they want to, of course, ride
out the occasional rough patch, but there is still the possibility of a
publisher deciding it is not worth the trouble.

The mainstream publications want to include some technical material
so that they seem "balanced", but from seeing the ARRL and RSGB as well
as some independant publishers advertise for specifically technical
articles, it seems they are in short supply. The mainstream publications
tend to avoid (there have been honourable exceptions) anything that
looks too advanced, fearing that it may discourage readers, or that
no-one will build it anyway. Surveys have shown that many people read
constructional articles, yet few build the project. This means that much
of the value of even a constructional article is
entertainment/educational in nature. The RSGB seem to have responded to
the results of their last survey, the last few RADCOMs have carried a
series about an advanced receiver at circuit diagram and explanation
level, but without constructional details. This has made some people
aware of newer circuit techniques beyond the classical ones. The ARRL
has recently published a series of non-constructional articles by Ulrich
Rohde, very much in the style of what he used to put in "Ham Radio" that
illustrates the bad design choices that have become the norm in the main
brands of "store-bought radio".

I can see evidence that some mainstream publications are broadening their coverage. It seems good to me. If you are a contester or DXer, it would still be worth your while reading "heavy" technical articles if you want to get the best results in your main pursuit. The ARRL series mentioned might look heavy going to some people, but it tells a lot about bad design practices present in the radios the contesters are using - it also shows a very very simple fix for one big design error in just about every HF radio in production. Contesters and DX'ers like to compare themselves with long endurance motor racers - well, a competent engineer has just discovered that all current production HF rigs have the wrong grade of spark-plugs fitted, and are badly down on power as a result. What spoils the analogy is that car racers are unlikely to say "That's too technical for me - I never open the hood" and go out onto the track to race for their reputations with the bad plugs.

How many amateurs are going to fit more suitable diodes in their receiver front-end filter switching ?

Ironically, this is a problem that will most spoil reception in crowded band conditions and co-sited station conditions - exactly where the contesters and DXers work hardest.

Stirrer done with !

Well, they are doing it here. The rf shops are full of those contester rigs in for the sparkplug changeouts. One of the biggest problems was finding a cheap second source for those @#$%& overpriced HP diodes ;-)

There are no stupid questions, only stupid people that roll their eyes when you ask.

2m (and 70cm) SSB are some of the FEW places hams still act civil and treat each other with respect. If your local ham store has some 2m SSB gear, BUY IT! You won't make contacts like on the repeaters, it'll be a challenge, and you may not hear anyone until your local 2m SSB net meets, but I'm having fun.

HEY, keep it quiet, will ya?

Hamfest at Oakland NJ........

Aug. 20th. Buyers 9 a.m. (per 8/94 QST). Directions from south; Take
I-287 from GS Parkway to I-287 (NJ) exit 58. Take 202 South a short
distance. Turn right onto OAK Street. Follow OAK Street to the end
about 1/2 mi.) to parking. Sponsor Ramapo Mtn. ARC.
Note that I-287 is now completed from Woodbridge area all the way to
the junction with Route 17 in Mahwah at the NY State line.
Even though the time is listed in QST as 9 a.m., I've always been
there at 8 a.m. and there was already alot of activity by then.

2811. Narrowband PCS Auctions

Newsgroup: rec.radio.amateur.misc
Date: 1994-08-18 15:50:28 UTC
From: henryc@access.digex.net
Message-ID: <330004$dqp@access2.digex.net>
Source record: 261380
Cross-posted to: rec.radio.info,rec.radio.amateur.misc,rec.radio.noncomm,rec.radio.broadcasting,rec.radio.amateur.policy

The FCC is moving fast in establishing the information superhighway through spectrum auctions. On August 17, 1994, the FCC released the following auction notification for Narrowband PCS:

FCC RELEASES NARROWBAND PCS RECONSIDERATION ORDER
AND FURTHER NOTICE OF PROPOSED RULEMAKING

The Commission today released an order on reconsideration of its Third Report and Order (Third R&O) which established service-specific rules for competitive bidding for the award of narrowband PCS in the 900 MHz band.

The reconsideration builds on the successful completion of the first simultaneous multiple round auction of 10 nationwide narrowband PCS licenses. The Commission made minor changes to its auction rules and strengthened provisions designed to enhance opportunities for designated entities.

Auction Rules

The Commission retained the flexibility to release bidder identities. It will announce in advance of an auction by Public Notice whether it will release bidder identities. The Commission retained discretion to set suggested opening bids or minimum opening bids in order to speed the auction process. The Commission said it would defer until after the regional narrowband PCS auction a final decision concerning the auction design for the 12.5 kHz MTA and BTA paging response channels.

Designated Entity Provisions

The Commission took three steps to enhance the opportunities for designated entities to participate in the auctions and in the competitive provisio provision of service.

Finally, the Commission issued a Further Notice of Proposed Rulemaking in which it indicated that it will consider whether "entrepreneurs' blocks" similar to those adopted for broadband PCS would be appropriate for promoting participation of designated entities in the remaining narrowband auctions. The Commission asked for comment on whether up to 4 MTA and 2 BTA licenses should be included in the plan, if it adopts an entrepreneurs' block. In addition, the Commission asked whether the BTA licenses should be licensed on a regional or national basis.

The Commission also asked for comment on the following issues with respect to an entrepreneurs' block:

Whether bidding credits should be granted to small licenses for a period of three years from the date of the license grant; and whether, for a period of years after that, the Commission should permit the licensee to assign or transfer control of its authorization only to an entity that satisfies the entrepreneurs' blocks entry criteria.

Around here, most patches are *NNNNNNN (N= phone number) and # to
drop it. Always identify before doing any touch-tone stuff so that people
won't think you are messing around with the repeater.

Also, I'm very proud to say that here in Columbus the two repeater
clubs have kept the patches open to everyone and giving out the */# code is
no problem. We have seven open patches on 2m and a few on 440. There are no
closed repeaters and only a couple closed patches. Yes, at times the system
gets abused by non-members, but more often than not people will eventually
join the clubs after seeing how they operate. We have an idea situation here!

> Korea early next year. I have several questions about operating
> there. I would appreciate hearing from any hams that have
> recently operated in Korea. Thanks

I just retired after doing 20 years. Thank gawd I'm out!

Anyhoo, I was in the R.O.K. from Jun of 89 to Jun of 90. Held the callsign
of HL9ZF. It seemed at the time that most of the hams were concentrated
between Osan and Seoul. So, the AARCK (American Amateur Radio Club of Korea)
held its meetings monthly -- alternating between both locations.

There were a few other hams scattered throughout the ROK and once in a while
they would make it up to Osan or to the Youngsan Main Post in Seoul. During
my tenure there I believe there were 80 some-odd American hams in country. Out
of that number there were probably 30 or so who were active. Those of us at
Osan were the most active in the country.

The 1st Signal Brigade ran the licensing program. They probably still do. If
you are going to Osan you shouldn't have any problems obtaining your license.
I had mine within a week of arriving in country. It didn't do any good to
apply before getting there. I tried and never heard a thing from anyone.
Once I got there I got a hold of Kent Kuehn (sp?) who is still HL9OB but no
longer on active duty. I believe he works for the University of Maryland in
Seoul now. Since I retired I haven't heard from him. I did work him in a
contest once in 1992, while stationed at Holloman in New Mexico, but haven't
put my tower up since moving to New England.

Wish I could be of more help to you. The ARRL has the address for the
1st Signal Brigade. I wrote to them before I left New Hampshire in 89 but
never received a reply.

You might want to look for the address to the AARCK in a DX callbook. I
believe there is a section for Americans licensed overseas. I don't have a
current one. You might also consider writing to Kent, HL9OB. He's been
listed in callbooks over there since the extinction of the dinosaur. You'll
meet him I'm sure. He's Mr. Ham Radio over there along with HL9HH, Harry Herr.
Tell them both I said hello. They'll know who the Zipper Flipper was.

73 fer now
de WK1V (ex-HL9ZF)

2816. TS-690S AND TRANSVERTERS

Newsgroup: rec.radio.amateur.misc
Date: 1994-08-18 17:22:44 UTC
From: Gary_Rogers@DGC.ceo.dg.COM
Message-ID: <9408181822.AF00036@rtp41.rtp.dg.com>
Source record: 261561

Message:
Greetings, All, I'm setting up my 432 MHz station and I'll be using a Kenwood TS-690S as the IF. I know it can be done with a bit of effort, but I need some input. If anyone can give some suggestions, they would be greatly appreciated. I have two questions:
1) The xvtr input is set up for 26-30 MHz, so I'll need to mod the rig. I've seen one to do an expanded transmit. Has anyone done this? Since the normal modes of transmitting on the ham bands involves a selection of filters, what filtering is used if the output is on a frequency the radio isn't normally designed to handle? Are they bypassed altogether?
2) My xvtr needs only 1mW drive, but I can only lower output to 10W using the front panel controls, so I'll need to go through an attenuator (about 40dB if I figure correctly). As the xvtr has separate input and output ports, what's the best way to split the signal? Bring out the receive line to a separate connector on the rcv side of the internal t/r switch? Build a box with a coax relay and the transmit side going to the attenuator and the receive going straight through? If I bring out a separate rcv line, I'll be bypassing the rig's filter section. Any problems here?
Tnx, Gary WA4YMZ Gary Rogers@dgc.ceo.dg.com (Not speaking for DG!)

2821. GB2RS News 21st August 1994

Newsgroup: rec.radio.amateur.misc
Date: 1994-08-18 18:17:51 UTC
From: dave@llondel.demon.co.uk
Message-ID: <777259071snx@llondel.demon.co.uk>
Source record: 261391
Cross-posted to: uk.radio.amateur,rec.radio.amateur.misc,rec.radio.info

Good morning. It's Sunday the 21st of August and here is the GB2RS news broadcast, prepared by the RSGB and intended for all radio amateurs and short-wave listeners.

First the headlines:-

September RadCom is scheduled to be posted this week,

RadCom Readers' Award nominations due in, and

Ongoing discussions with the Science Museum.

September RadCom will be posted out to members on Monday the 22nd of August. This issue includes details of RSGB Council vacancies which will exist at the end of 1994.

The closing date for RadCom readers' awards is the 30th of August. See July RadCom page 6 for further details.

Following on from last week's statement regarding the GB2SM Science Museum station, the RSGB and representatives from the museum are currently engaged in discussions in an effort to save GB2SM from closure.

We now have news of some RSGB awards. Roger Betts, G0TRB, has received the RSGB Supreme Transmitting Award in recognition of his three Senior Awards, covering 144, 432 and 50MHz. Roger also updated his award level to 50 countries on the 50MHz band.

On 70MHz Derek Thom, G3NKS, has gained two RSGB certificates, one for 60 counties, 40 locator squares and 8 countries confirmed.

Further details of the RSGB VHF and UHF awards can be found in the RSGB Call Book or may be obtained from the VHF Awards Manager, Ian Cornes, G4OUT whose address is correct in the Call Book.

The latest batch of repeater applications forwarded by the RSGB to the Radiocommunications Agency includes three new Packet Repeaters: GB7KL for Kings Lynn, GB7PL for Plymouth and GB7ME for Danbury, Essex. One new Repeater, GB3VX, a 24 centimetre Television Repeater for Heathfield, East Sussex and one frequency change, GB3TG, a 3 centimetre TV Repeater covering Milton Keynes and one site change, GB3GJ, a 2 metre Repeater covering Jersey. These have been processed by the RSGB's Repeater Management Group to whom any enquiries should be addressed.

It is anticipated that the minimum time for clearance of UHF repeaters by the RA is six months. As usual, the Society will keep repeater

keepers informed of progress by distributing the RA's monthly progress reports.

Now some items of HF DX news from the weekly RSGB DX News Sheet which is edited by Brendan McCartney, G4DYO.

From Switzerland, the special callsign HB4JAM will be aired until the 25th of October, in connection with the Swiss National Camp for Scouts and Guides at Willisau, near Lucerne.

From Waganiha Island, UE1QDX and UE1QQQ will sign RA1Q until today Sunday the 21st on all bands, except WARC, on CW and SSB.

From Singapore, the special prefix S61, in lieu of 9V1, will be used until the 12th of September, to celebrate the 25th anniversary of the Singapore Amateur Radio League.

We know of three rallies taking place today, Sunday the 21st of August:

The Great Eastern Rally is being held at the Cattle Market, Hardwick Narrows, Kings Lynn. The market is located just off the A10, at its junction with the A47. Doors open at 10am, or 9.30 for disabled visitors. The event features trade stands and a bring and buy stall indoors, and a car boot area outside. Refreshments will be available. The site has easy access for the disabled as it is all on one level.

The Southend Rally is being held at the Rocheway Centre, Rochford, Essex. Doors open at 10am. The event features trade stands and, weather permitting, a boot sale for radio, computer and electronic equipment. Talk-in will be on channel S22.

The West Manchester Radio Clubs 'Red Rose' Rally is being held at the Bolton Sports and Exhibition Centre, Silverwell Street, Bolton. Doors open at 11am, or 10.30 for disabled visitors. The event features over 70 trade stands, society stands and a bring and buy stall, all at pavement level. Refreshments will be available all day.

Next the one event we know of, lasting three days next weekend, from Saturday the 27th until Monday 29th:

The Computer Fair 1994, which includes a Radio and Electronics Fair is to be held at the Show Grounds, Aldridge, West Midlands. The showground is located just off the main A454, Aldridge to Walsall road, some 4 miles from A5 or some 5 miles from M6 junction 7. Doors open at 10am, or 9.30 for disabled visitors. The event features a summer spectacular with various shows, displays and other interests. For further details telephone 0543 372807 after 5pm during weekdays or any-time at weekends.

Now the five events for next Sunday the 28th:

The Coleraine and District Amateur Radio Society Rally will be held at the Lodge Hotel, Coleraine, County Londonderry. Doors open at 12 noon. The event features the usual trade stands, a bring and buy stall and other attractions. Refreshments will be available. Talk-in will be on

two metres, channel S22. Details from Jim, GI4ORI on 0265 52393.

The East Coast Amateur Radio and Computer Rally is to be held at the Clacton Leisure Centre, Vista Road, Clacton on Sea, Essex. Doors open at 10.30am. The event features trade stands, including radio, computers, software and accessories and a bring and buy stall. Refreshments will be available from 11am. Talk-in to be on channels S22 and SU22. Details are available by telephoning 0473 272002.

The Galashiels and District Amateur Radio Society Open Day is to be held at the Focus Centre, Livingstone Place, Galashiels, Borders. Doors open at 11am. The event features all the usual trade stands, club stalls and a bring and buy stall. Refreshments will be available. A new attraction, a bring and sell stand. Details from John, GM0AMB on 0835 822686.

The Gloucester Radio Rally will be held at Nass Lane, Quedgeley, Gloucester. The site is located just off the old Bristol road, look for the signs. Doors open at 9am. The event features a bring and buy stall, a car boot sale and flea market stalls. Details from Mike on 0452 503786.

The Torbay Rally is to be held at the Clenon Valley Leisure Centre, Paignton, Devon. This is a new and larger venue for the rally. Doors open at 10am. The rally features many trade stands, an RSGB Bookstall and Members service stand, a bring and buy stall and special interest displays. Refreshments will be available. For the family, some four minutes walk away, there is a boating lake, a beach, a steam railway and a flume water park. Details from John, G3YCH on 0803 842178.

And finally, the two events to be held on Monday the 29th of August:

The Huntingdonshire Amateur Radio Society, 6th Annual Bank Holiday Monday Rally and Junk Sale will now be held at St Peter's School, St Peter's Road, Huntingdon. This is a change of venue from the one published in RadCom. Trading commences at 10am, now in two halls, with car boot pitches also available adjacent to the halls. Hot and cold refreshments will be available. Talk-in will be on two metres, channel S22, or via GB3OV on 433.125MHz, RB5. Details from David, G7DIU on 0480 431333.

The Scarborough Radio and Electronics and Computer Fair is to be at The Spa, South Foreshore, Scarborough, North Yorkshire. Doors open at 11am, or 10.30 for disabled visitors. The event features the usual trade stands, a bring and buy stall, Club and Group stalls and RSGB Books. Morse Tests will be available on demand, but please remember to bring two passport size photographs. Talk-in will be on two metres, channel S22. Further details from Ross, G4NZ on 0723 514767 after 6pm.

Now for the HF contest news:

The South-East Asia Net DX SSB Contest finishes today Sunday the 21st at 2359, after 48 hours, on 1.8 to 28MHz, but not WARC bands. For further details see July RadCom page 19.

The RSGB SSB Field Day Contest takes place during the weekend, Saturday the 3rd and Sunday the 4th of September on 3.5 to 28MHz, but excluding the WARC bands. Full details can be found in the June edition of RadCom.

Next some VHF contest news:

The RSGB's 432MHz Fixed and Listeners Contest takes place today, Sunday the 21st, from 1700 to 2100 UTC. There are three sections, Single Operator Fixed, Others Fixed and SWL. See May RadCom page 79 for further details.

The next RSGB 10GHz Summer Cumulative Contest takes place from 0900 to 2100 UTC next Sunday the 28th of August. See April's RadCom page 82 for further details.

The Firth Weekend takes place next Saturday the 27th and Sunday the 28th, when eleven Special Event Stations will be established overlooking the Firths of Scotland. All stations will be active on 10 through 80 metres on SSB, with some activity on VHF/UHF between 8am on Saturday until 6pm on Sunday. See August RadCom, page 29 for awards details or contact Mike, GM4SUC on 0292 443127 for further information.

GB1WAS and GB2WAS will be operated by members of the Hoddesdon Radio Club at the Wood Green Animal Shelters, London Road, Godmanchester, Cambridgeshire during next weekend. The occasion is the Charity's Fun Days with the proceeds from the Sponsored Special Event Station going to the Animal Charity. Operation will be from 0001 on Saturday the 27th, until 1800 on Monday the 29th of August, using GB1WAS on 2 metres SSB, FM and Packet and GB2WAS on 80 to 10 metres. See September RadCom page 7. Over the three days over 10,000 people are expected to visit the centre. More information can be obtained from John Rudd, G7OCI, on 0920 466639.

Other Special event stations active this month include:

GB2QE, which will be aired by the Wirral and District Amateur Radio Club, from Perch Rock Lighthouse, New Brighton, Wirral, to celebrate the visit of the Cunard Liner, the QE2 to Liverpool. The visit lasts from Saturday the 27th of August, until Thursday the 1st of September. Operation will be SSB on 80, 20 and 2 metres and skeds have already being arranged with G3UXO/MM on the QE2. Details from Ron, G3HFA, whose address is correct in the RSGB Call Book.

And now the solar factual data:

The period from the 8th to the 14th of August has seen solar activity at very low levels, with the geomagnetic field being very quiet rising to unsettled by the end of the period. An M3.9/1N flare occurred on the 14th accompanied by radio bursts. This is the first M type flare reported for just over 6 weeks. The sunspot indices started very low, but rose during the period with the 14th being the highest day with a count of 75. The mean for the period was about 46.

The solar flux levels have also risen, from 74 up to 89 units by the 14th giving an average of 79 units. The 90 day flux average on the 14th was 79 units.

The geomagnetic activity rose from very quiet levels of an Ap index of only 2 units on the 8th, with the planetary K index recording 3 zeros, up to a sub storm level of 28 units by the 14th, due to the passage of a coronal hole. Most of the period was unsettled, with the Ap average being 16 units for the period. The state has been 'nil nothing to report' all the period. The aa indices as supplied by the British Geological survey for the period the 2nd to the 8th of August, were very quiet. The daily indices averaged only 7.2 nanoTeslas about K1, with the 8th being very quiet at only 4.5 nanoTeslas, with periods down to 2 nanoTeslas. This is the quietest day since May 1993.

The X-ray flux levels started the period at A1.8 units before climbing again to reach a sudden peak of B1.3 on the 13th, but just as quickly declined again. The average for the period was A5.6 units. The electron fluence levels continued to fall over most of the period being near-normal, but the M flare on the 14th pushed levels back up to high, but it is not expected that this will be maintained. The monthly average of the Planetary Ap index for July was 11, with the smoothed level for last January being 18.0 units.

I'll repeat the figures. Spots - 46; Flux - 79; Ap index - 16; X-ray flux - A5.6; July Ap 11.

Now the ionospheric data for Central France:

Due to holidays at Meudon, not all the data is to hand, so the F2 daytime critical frequencies at Poitiers are approximate. The daily highs averaged about 6.7MHz, and the darkness hour lows about 2.7MHz. The highs are still being recorded about 20.00 hours, and the lows about 04.00 hours. The 10th and 11th were affected by blanketing E and periods of spread F.

I'll repeat the figures. Highs - 6.7MHz; lows - 2.7MHz.

There is no data is to hand from Ekaterinberg this week. The latest smoothed predictions for the coming minimum for spots is April/May 1996, with a count of about 6, and the solar flux minimum is expected about October 96, with about 69 units.

And lastly the solar forecast:

This week, the active side of the sun will be looking our way. Solar flux levels are expected to be about the 85s. Based on past history the geomagnetic activity is expected to be quiet to just unsettled. MUFs during daylight in the south are expected be about 18MHz, and the darkness hours about 10MHz. North/south paths will be the best. Sporadic E is still possible on 10 and 6 metres though of lower intensity.

And that's the end of the solar information.

Finally in the main news, SSL has informed the Society that as of last Wednesday morning, the latest callsigns issued were in the G0 Victor Echo and G7 Tango Kilo series, and Novice calls in the 2 0 Alpha India and 2 1 Delta Hotel series. .

--

GB2RS is prepared by the Radio Society of Great Britain and is broadcast in the 80m, 40m, 6m and 2m bands.

2822. mods list for 5100 & 5200

Newsgroup: rec.radio.amateur.misc
Date: 1994-08-18 18:21:39 UTC
From: brian@positron.amd.com
Message-ID: <Cuqto4.9yq@txnews.amd.com>
Source record: 261564
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.equipment

-=-=-=

I expected a type "N" connector, the radio came with UHF.

Control wart: (are you listening Yaesu?) You can only transmit on the "main" (ie. left) side of the radio. When both 2m and 70cm receive are active, you change bands with the "BAND" button. This swaps the left and right displays. When dual in-band receive is active, the "BAND" button changes both the main and sub receivers from 2m to 440 or from 440 to 2m. Arrrgh!!!! I would prefer a "SWAP" button to swap left and right regardless of mode. (The "SUB" button is used instead.)

Automatic backlight dim: works as advertised but the backlight level under low ambient lighting is WAY too low. Manual control is the best solution.

DTMF page: works as advertized, but the *&%$#@ thing insists on "ringing" like a phone EVERY time it receives the page sequence. This means that you have to co-ordinate with the other station to turn the *&%$#@ DTMF stuff off at the same time or tolerate the "ring" at the start of every receive.

CTCSS decode: squelch opens quickly when normal CTCSS decode (an option) is enabled. There is a CTCSS page function that has a distinct delay between receipt of carrier with CTCSS and open squelch. I don't yet understand the use of this "feature."

There is no SCAN button on the front panel. Scan is initiated by holding the up or down button of the mike down for two seconds. The scan is blindingly fast when compared to the Alinco 590 that I used to have.

Memory: memory is divided into four "banks." Two for VHF, two for UHF. Only one bank can be active for each receiver. I consider this an advantage, but you may not. There are two obvious (to me) uses for this configuration. First, you can store frequencies for different uses in different banks. Second, you can activate one 2m(440) bank in the main receiver and one the other 2m(440) bank in the other receiver and scan them simultaneously.

Heat management: After seeing the HUGE heat sink on the back of the Alinco 590, the Yaesu 5100's sink seems too small. In a key down experiment, the heat sink of the Yaesu got almost too hot to touch before the fan kicked on. If I were planning to run a packet station, I would definitely look into some extra forced air over the back of this one. As it is, I'm a bit concerned about how hot it will get mounted in my dashboard. [Others people don't seem to have this problem.]

DTMF Decode and Scan: If you have CTCSS decode (an option) enabled on a memory and you are scanning and there is activity on that frequency but without the correct CTCSS tone, the 5100 stops scan, flashes the strength meter and then continues

scanning. It is slower than normal scan, but still quite fast.

Attributed: Brian McMinn, N5PSS, brian.mcminn@amd.com

-=-

Wireless Mike (review):

The wireless mike sends audio over 49.85MHz, so it is can't be used in high RF environments (like near computers). It duplicates ALL front panel controls with the exception of the power button.

It interfaces to the rig via a standard mic plug. The receiving unit is only about 1'h x 2w x 1/2d.

[ed] The implications of this are that the entire radio can be controlled via the microphone port! Too bad there isn't a fancy *wired* mike with all the controls on it.

Several people have reported trouble with the mike -- enough trouble for them to return it because of poor range and poor audio. It works well if you sit on top of the pickup unit, but then you don't need a wireless mike.

Attributed: Tony Pelliccio, KD1NR system@garlic.sbs.com

-=-

Backlight Control (both):

Effect: manual control of backlight

1) Hold down the MHZ key and turn radio on
2) Use tuning knob to adjust brightness
3) When FUNC is active, the tuning knob will adjust brightness again.
4) You can restore automatic control by repeating step 1.

Notes: Manual is fuzzy on this feature.

Attributed: Yaesu

-=-

Crossband Repeat (reported as working on 5100 and 5200):

Effect: Enable crossband repeat

[ed -- Note that there is a 5200 specific crossband mod that appears later in this list -- I don't own a 5200, so I can't test either. This key sequence works on my 5100.]

1) Dial up two frequencies you want to crosslink (be sure to pay attention to transmit offsets, if any)

2) Turn radio off.
3) Hold down the RPT key and turn radio on

Result: The tone encode/decode flags and the -+ flags will be flashing and the radio will be in low power mode. When either band's squelch opens, the other band is moved into the primary frequency display and the transmitter keys. Audio link appears to be speaker to mike.

Exit crossband repeat mode by repeating steps 2 and 3 above.

Attributed: Yaesu

-=-

Crossband Audio Enhancement (both):

Effect: unmuffle crossband audio

Connect a 27K ohm resistor between the audio-in and audio-out leads on the data jack (inside the shell of a mini plug, that is). The mic element stays live while in crossband operation. It is a good idea to remove the mic from the rig while cross banding if you need/want to eliminate ambient audio.

[ed note: This mod was for the "old" style data jack. I don't know what the effect will be on the "new" style data jack.]

Attributed: Bill Mayhew, N8WED, wtm@uhura.neoucom.edu

-=-

Transmitter Timeout (both):

Effect: automatically limit transmitter "on" time

1) Hold down the HIGH/LOW button and turn radio on
2) Use tuning knob to change the number in left VFO. This number is number of minutes for the timeout timer. The factory default appears to be 15 minutes.
3) Transmitter shuts off with "Err" displayed in VFO if the time limit is exceeded.

Attributed: Bill Mayhew, N8WED, wtm@uhura.neoucom.edu

-=-

DTMF decoding (neither): :-(

Effect: display decoded DTMF tones

Ed Note: this works on the FT-530, but not on the 5100. I'm including it here on the chance that it works on the 5200. Please try it on your 5200 (or 5100) and tell me if it works for you.

1) Select frequency and turn on the code squelch
2) Press Function-Page(Code) to select a code memory
3) Dial up to memory #7 [the 5100 won't do this]
4) Watch the dtmf's scroll by as they are heard by the radio!

Attributed: jmeyers@ecst.csuchico.edu (Jeff Meyers)

-=-

The "P" Key on the microphone (both):

I was curious about that "P" key on my FT-5100, so I called Yaesu and they explained the situation. They designed the the mic to accommodate "future products". The "P" key is there to be taken advantage of at a later date by other models. They just did not want to re-design the mic again within a short period of time.

Attributed: Will Collier, KB5WRK, COLLIER@gallant.apple.com

-=-

Tech Manual (both?):

The technical manual for the 5100 is [information wise] pretty spare. No additional operating notes or hidden secrets are revealed. It is worthwhile for the alignment notes and complete parts list. Call the number in your owners manual to order.

Attributed: Bill Mayhew, N8WED, wtm@uhura.neoucom.edu

-=-

Wireless Mike Problem & Fix (both):

Effect: Unexpected/Undesired Transmission

The wireless mike will pick up any transmission in the 49MHz range (including cordless phones and baby monitors) and re-transmit them on the ham bands. Don't leave your radio on and unattended with this option installed.

Attributed: kenh@w8hd.org (Ken Hoehn)

The Fix:

There's a modification for the MW-1 that will only let the radio key up when it receives both the 49MHz signal and an infrared command from the MW-1 remote. I think they list it in the users manual for the MW-1. [ed. with this enabled, some have complained that the transmit is intermittent.]

Attributed: system@garlic.sbs.com (Tony Pelliccio)

-=-

Band Limit Scan (both):

Effect: use one or both band limits

By marking one of the L, U, 1L, 1U memories as "skipped," the
limited band scan will only use the other pair of band limits.

Attributed: Brian McMinn, N5PSS, brian.mcminn@amd.com

-=-=-=

9) Turn on the radio. Radio will now show 300.000 & 20.000 on
display.

NOTE You can re-enter band edges any time after this by
pressing and holding [D/MR] [F/W] [REV] keys while
turning the radio on. Unfortunately, this operation
clears all of the memories.

10) Set UHF Rx Low - Press [MHz] and dial 420.00, press [D/MR]
11) Set UHF Rx High- Press [MHz] and dial 475.00, press [D/MR]
12) Set UHF Tx Low - Press [MHz] and dial 420.00, press [D/MR]
13) Set UHF Tx High- Press [MHz] and dial 450.00, press [D/MR]
14) Set VHF Rx Low - Press [MHz] and dial 128.00, press [D/MR]
15) Set VHF Rx High- Press [MHz] and dial 180.00, press [D/MR]
16) Set VHF Tx Low - Press [MHz] and dial 140.00, press [D/MR]
17) Set VHF Tx High- Press [MHz] and dial 150.00, press [D/MR]

NOTE magical Rx/Tx band edge setting mode ends here,
remainder goes as stated in manual. Repeater offsets
and tuning steps vary by state/country so following
numbers are not "fixed".

18) Set UHF offset - Press [F/W] then [RPT] dial 5.000 press [RPT]
19) Set UHF tuning - Press [F/W] then [REV] dial 25.0 press [REV]
20) Change band to VHF - Press [BAND]
21) Set VHF offset - Press [F/W] then [RPT] dial 0.600 press [RPT]
22) Set VHF tuning - Press [F/W] then [REV] dial 20.0 press [REV]
(VHF tuning step varies by state -- many use 15.0)

Diagram: [there are no tabs in this section - ed]

Ok, here's where it gets tricky, but so you know, a '|'
represents a jumper.

-=-

Band Switching or Tone Burst via D/MR button on microphone (5100):

Effect: D/MR button on microphone performs band switching or
1750 Hz tone burst rather than D/MR function.

NOTE Since there is only one [D/MR] button on the mike, it
is of course impossible to get both of these functions
at same time. Make your choice.

For band switching:

1-5) as in above mod
6) Remove the jumper on Pad R4067
7) skip above step 7
8) continue with step 8 above

For tone burst:

1-5) as in above mod
6) Add the jumper or 0 Ohm resistor on Pad R4065
7) skip above step 7
8) continue with step 8 above

Attributed: Tony Pelliccio, KD1NR system@garlic.sbs.com
Riku Kalinen, OH2LWO riku.kalinen@juha.fi

-=-

Remote Control Mike Interface (5100, maybe 5200):

Effect: remote (wired) control of radio

The Remote Control Mike (from Yaesu) uses a serial data stream
interface in the microphone jack to control the 5100. This
simple hardware interface allows a computer to control the
5100 in the same way. It is somewhat similar to the CAT
interface I have built for my FT-757 HF rig, but mostly like
the interface described in the FT-912R manual (loaned to me
via a friend from Yaesu). When using my PC as the source for

the serial data, I used a MAX232 chip for a level conversion between the +/- 12 volts levels on the computer and the 0-5 volt levels on the radio.

The serial data parameters are 4800 N82. The commands sent to the radio are simple one byte instructions. The RMC mode ON command (16) must be sent before any other command. When the RMC mode is ON, a small LCD "RMC" icon will light on the display (see owners manual under Display). Also, the Vol, Sql, and Bal knobs are disabled when in the RMC mode because they will be controlled via serial commands, but all other buttons are still active.

The commands are as follows:

0 - RPT 12 - CALL 24 - SQL Up
2 - REV 14 - BAND 26 - VOL Up
4 - MHZ 16 - RMC 28 - BAL Right
6 - D/MR 18 - SUB 30 - BAL Left
8 - TONE 20 - PAGE 32 - SQL Down
10 - LOW 22 - F/W 33 - VOL Down

The interface I built simply wired mike port pin 7 to serial ground and pins 1 and 3 each through a diode then together, to the serial source. Note: I am not a hardware person! Use this hardware at your own risk.

```
+----1 7------------- GND
| 2 8 6 (These can be connected to a MAX232
| +--3 5 +-+-------- SER IN or the FIF-232C pins 1 and 3)
| | 4 | |
| +--->|---+ |
+----->|-----+
```

You can wire 1 and 3 together first, then through 1 diode, but that disables the UP and DOWN buttons.

I'll continue to study this more. If anyone would like to know more, or has any corrections or feedback, please email me.

Attributed: Byon Garrabrant, KD6BCH byon@csulb.edu

-=-

Dual 2m receive oddity (5100 only):

Effect: Receive's 2m frequency in wrong place

When in dual receive mode with two 2 meter frequencies displayed, the 5100 will receive a strong 2m signal at both the correct frequency (f) and at (292MHz - f). For example, the 146.78 repeater will be heard at 145.22MHz. This "image" can be received on both the main and the sub band tuner. If

both the true and the image frequencies are tuned at the same time, they will interfere with each other (ie. they are very close to 180 degrees out of phase).

Attributed: Brian McMinn, N5PSS, brian.mcminn@amd.com

-=-

Fan Control (5100 only):

I have the service manual for the FT-5100. There doesn't seem to be any trimmer pot that can be set to change the fan's trip point. In fact, the wiring diagrams don't seem to even show the fan. The 144 MHz PA board has a thermal cut-out switch that feeds back to the PROT line on the main board. That doesn't seem to be related to the fan operation, but rather to shut the transmitter down for massive error conditions.

I'd have to take my 5100 apart, but from the implication of the service book, it looks like the temperature sensor might be integral to the fan itself.

Attributed: Bill Mayhew, N8WED, wtm@uhura.neoucom.edu

-=-

Data Port Model Update (5100 only?):

In late 1993 or early 1994, Yaesu re-designed the data port on the 5100 to conform to the newly released Japanese radio maker's "standard" for direct 9600 baud connection. One of the prices for going to 9600 baud is a change in pre/de emphasis technique. Although the changed pre/de emphasis made the data port work at 9600 baud, it no longer works at 1200 baud.

On an "old" (pre 1994) 5100, 1200 baud works fine via the data port and 9600 baud is impossible.

On a "new" (1994 and later) 5100, 9600 baud works fine via the data port and 1200 baud can only be done by wiring through the microphone port (where TX and RX audio is available).

Band Switching or Tone Burst via D/MR button on microphone (5200):

Effect: change function of D/MR button on mike.

This is based on information from Yaesu in Japan.

The functions of pin 5 (the microphone button) can be altered
by changing jumpers in the control head. To find these
jumpers, see the section on packet radio in the ordinary
instruction book.

Control Head Jumper No
Pin 5 Function Closed Jumper Marked By X
1 2 3 4 5
D/MR X
Band X
1750Hz Tone Burst X X
Main band Busy Out X
Sub band Busy Out X
Call Channel X X

Main / Sub band busy out - When open SQL = 5 Volt DC
Closed SQL = 0 Volt DC
[ed - I'm not sure what this means since I don't own a 5200]

Attributed: John Newgas, G7LTQ jnewgas@cix.compulink.co.uk,
g7ltq@g7ltq.ampr.org

-=-=-=

screws). For convenience, remove the speaker, noting which way the two pin pcb connector is oriented. [ed -- does it matter?]
4) Remove two side screws holding on the front of the chassis and remove chassis front. (The chassis front is the surface with the contacts for the control head.)
5) Locate a double row of ten by two jumper spots, numbered 1 to 20. The jumper configurations will depend on the area for which the rig was intended. Note the arrangement if you ever want to un-modify your radio.
6) Using a fine-tip soldering iron, set the jumper spots as follows:

1 closed
2 closed
3 closed
4 open
5 closed (G7LTQ says open here...)
6 closed
7 closed

These jumpers are located in the main radio case. For location, refer to the FT5200 Technical Guide. [ed -- looks like the Tech Guide calls them JP5001 to JP5007]
7) This completes the alteration for frequency expansion. Reassemble the radio.
8) Reinitialize the radio by turning it on while holding [D/MR], [F/W], and [REV].

NOTE There are several different versions of step 9 and I don't know which is most correct. -- ed

9a) (from Hugo Cornwall) You must now program in the band limits. The display will show a blinking "1" in the left-hand memory box and "000.000" in the left-hand frequency display. (Ignore the right-hand display for now). The following limits are suggested, but the RF circuitry of the rig will only cover slightly less. Use the dial or up/down buttons to select the frequency and then press [D/MR] to store it. The blinking "1" will increment.
VHF rx: 137.000 174.000
VHF tx: 137.000 174.000
(display will show blinking "1" and "300.000")
UHF rx: 410.000 470.000
UHF tx: 410.000 470.000
(Note: it is possible to set the RX limits wider than the TX limits; for obvious reasons you cannot have the reverse situation).

9b) (from Stu Kroner, N1JEF)
Select VHF range
select 118.00 Mhz press [D/MR] (VHF rx low limit)

select 174.00 Mhz press [D/MR] (VHF rx high limit)
select 140.00 Mhz press [D/MR] (VHF tx low limit)
select 150.00 Mhz press [D/MR] (VHF tx high limit)
Select UHF range
select 420.00 Mhz press [D/MR] (UHF rx low limit)
select 475.00 Mhz press [D/MR] (UHF rx high limit)
select 420.00 Mhz press [D/MR] (UHF tx low limit)
select 450.00 Mhz press [D/MR] (UHF tx high limit)

9c) (from John Newgas, G7LTQ)
Program in VHF low edge of Rx
VHF high edge of Rx
VHF low edge of Tx
VHF high edge of Tx
Repeat for UHF in the same order.

10) You can repeat the power-on-reset sequence above at any time if you need to change the limits.
11) The pre-set repeater offsets are now no longer available and you will have to set them up manually using the instructions on page 16 of the manual. The Automatic Repeater Shift (ARS) feature (also on page 16 of the manual) will also have disappeared and you will have no way of getting it back (except by changing the jumpers back).

Stu Kroner, N1JEF, skroner@mitre.org

-=-

Cross Band Repeater (5200)

Effect: enable crossband repeat

[ed - this is a continuation of the above]

1) You can enable the crossband repeater without altering the frequency coverage. The only hardware alteration is the removal of the link at jumper spot 17. (Note, just below jumper spot 17 is a separate jumper spot, not part of the group of twenty - leave this alone).
2) To enable, turn on rig while holding down [RPT] button. The rig is now a crossband repeater - you will get confirmation of this from the display: the 100s position on the two frequency displays will be replaced by a "R".
3) While in cross-band repeater mode you can change the frequencies of each band.
4) The crossband repeater suffers from desense. It works better at low power and even better if you use an external diplexer and separate antennas. The more isolation between the two bands, the better. As with all cross-band repeaters, results will be poor if the UHF frequency is a

direct multiple of the VHF frequency. If you are planning
extended use of a crossband repeater, make extra sure that
the rig is adequately ventilated.

Attributed: Hugo Cornwall

-=-

Crossband Repeat (5200):

Effect: crossband repeater
Bad effect: CTCSS function is lost

[ed -- there is another crossband mod in this list...]

This is based on information from Yaesu in Japan.

These jumpers are located in the main radio case. For
location, refer to the FT5200 Technical Guide.

1) Remove (open) JP5017 on the interface unit
2) Press and hold PRI button while switching on the power.
3) The FT5200 will now work as a cross band repeater.
4) The CTCSS function will be lost.

OK, folks, here is the weekly mini-posting reminder for the CWISTS.....

Note that all hands meet on the appointed 40 meter QRG at midnight
>>>>> YOUR QTH <<<<< local time. That will maximize the available
folks across +- 3 time zones of anyone's QTH at YOUR midnight hour.
Others can come and go earlier or later as may suit their habits.

The alternate QRG if the 40 meter one of 7102R5 khz fails is
is 3702R5 khz. (How can 40 meters fail us....?).

We are working on a EurAsian QRG for the rest of the world. More to
follow at a later time when the EurAsian ops get back with me.

2824. Code only Course, Ottawa Ont

Newsgroup: rec.radio.amateur.misc
Date: 1994-08-18 18:43:06 UTC
From: ac742@FreeNet.Carleton.CA
Message-ID: <Cuqunu.18G@freenet.carleton.ca>
Source record: 261568

I noticed in their recently delivered flyer that Algonquin College at their Lees Ave. campus will be offering a Morse Code only course starting on Sept. 8th and running until Dec 15th. It is once a week on Thursdays from 6:30 to 9:30. The course number is GEN5532 and it costs $138.41 (some of it tax deductible (talk to your accountant)). If you are interested, give Algonquin a call at 727-9565 (9am to 8pm Mon. to Thurs. and 9:00 am to 4:30 Fridays).

Also they will be offering their basic course on Tuesdays starting Sept 6 until Dec 13 (also 6:30 - 9:30pm). The course number is GEN5530.

The code course is offered only rarely and it is a great way to up-grade those no-code qualifications and get on HF.

|> Nooooo, nobody doing that stuff anymore.

|> By the way, who's selling and what they got?

This is pretty inaccurate statement. In the San Jose area there is a weekly evening net with 20-40 checkins! The real answer is that it depends on where you live as to how much activity you see.

Certainly the number of people using CW or SSB on 2m doesn't come close to the number of FM users, but there is still a fair number of folks out there. Don't forget the Satellite applications and the VHF contents. Both of these activities have a fair number of participants.

>That may have sounded like a stupid question, but a visit to the local
>ham radio store convinced me that 99% of the VHF stuff they sell are HT's,
>plus some less than enthusiastic responses from some local hams.

well, yeah.

most of the new radio sales are probably going to new guys and about the cheapest way to get started is to pick up a 2 meter HT when they're on sale. we'll have to check back in a lifetime and see if they accumulate a room full of stuff they don't use anymore.

i dunno -- it seems we have some sort of culture shock going on. since we didn't have much growth in the system (and only marginal replacement rates) we ended up with a lot of people with a lot of time in grade. the tech license has suddenly twisted this to a lot of new people all at once. i suspect in some areas of the country the elmers that normally work the crowd to develop their operating skills were suddenly overloaded. it will work itself out in time as the new guys become old guys and they get up to speed or develop new ways of doing things as needed (whether it is because of new blood or a lack of leadership from the old guard.)

To all radio amateurs

SB DX ARL ARLD051
ARLD051 DX news

The items in this week's bulletin are courtesy of Tedd, KB8NW, the OPDX Bulletin, Bob, W5KNE, the QRZ DX news bulletin and the Yankee Clipper Contest Club PacketCluster network. Thanks.

CHAD. F5IXR should start operations today as TT8/F5IXR and later as TT8XR. QSL via F5MXH.

ZAIRE. 4U/F6FNL has been on the air but little other info is available. 4U/F5LMG may be operating from the same area.

MONACO AND GENEVA. Luciano, I1YRL, plans to be active from 3A land and 4U1ITU from mid August to sometime in November. Luc operates mostly CW. W5ZPA planned to be on the air starting August 16, though no spots for this one have shown up on our local PacketCluster as of bulletin time.

FIJI. I4ALU is now signing 3D2CA until August 23 with some IOTA island hopping planned. After Fiji he moves on to KH6 for August 24, 25 and 26. QSL via I4ALU.

ROTUMA. 3D2RP was active on 20 meter SSB this past weekend. Check 14211 kHz at 0345z.

TUNISIA. Ron, AA5DX, is planning a trip around mid August. No further details are available at this time.

MADAGASCAR. Karl, 5R8KH, was heard this past weekend on 21295 kHz at 1700z. QSL via WB8LFO.

RWANDA. VE3MJQ recently arrived in Kigali for a six month stay. He hopes to receive a callsign soon. Plans are to operate mostly SSB. QSL via VE2PR. Alex, PA3DZN, will be in Kigali on UN related business. He plans to be on the air as soon as he can.

BHUTAN. Jim Smith, VK9NS, was on the air discussing the possibility of returning to A5 land. He mentioned that once permission to operate is granted, he can be in Bhutan in 48 hours due to equipment already being in place.

TURKEY. Bob, TA1/K4UEE, has been active for several days, mainly on 40 and 20 meter CW, though sometimes moving up the band to 20 meter SSB. He has said he would try to be active on 160 meters at 0100, 0200, and 0300z on 1827 khz, listening up.

IVORY COAST, SIERRA LEONE AND LIBERIA. Jay, K4ZLE, is going to be busy for the rest of the month. From August 13 to 20 and 26 to 30, he will be in TU land. August 20 to 23 has him in Sierra Leone. And from August 23 to 26 he will be signing EL2LE from Liberia. Jay operates mostly CW on 80 through 10 meters. QSL to his home CBA.

ARUBA. Jun, HJ4RHF, and Kumiko, JR4DUW, will be signing P40S and P40YL, respectively, for a week starting around August 24. Listen for their CW, SSB and RTTY on all bands. QSL via PO Box 61, Toyonaka, Osaka 560, Japan.

THIS WEEKEND ON THE RADIO. The ARRL sponsored 10 GHz Cumulative Contest has rules appearing on page 94 of June QST.

New Jersey QSO Party, sponsored by the Englewood ARA, is from 2000z August 20 to 0200z August 22. Operate CW and SSB, exchanging signal report, serial number and QTH. QTH is county for New Jersey stations, and Section, province or DXCC country for others.

The phone portion of the North American QSO Party and SEANET Contest are also this weekend. For the NA event, check page 126 of July QST. For the SEANET Contest, see page 118 in June QST.

The KCJ Contest, sponsored by the Keyman's Club of Japan, closes our operating events portion of the bulletin. Check page 126 of July QST for details on this contest.

>Do all/few/no brands offer that kind of accus?
>I hate the memory effect of NiCd accus ...
>
>Tnx,
> Detlef (DD3XD).

Detlef:

I have not seen any Nickel Metal Hydride battery packs offered yet, probably due to some charging differences between them and NiCd and the fact that most of the quality cells are diverted to volume users. You may want to keep an eye open for cells offered by VARTA (made by Toshiba) and some made by SAFT in France. With the increased cell capacities now available in NiCd, NiMH seems only practical in situations where every minute of runtime is critical....(Laptops, cell phones...etc.) Check out QST in the next few months for an article if you have access to a copy.

)) Jeff-

In my opinion, you would be a lot better off with a dipole for portable operation. I operate a TS-50S with a sealed gelcel battery and use small portable dipoles. The choice of wire is important- you need wire that will not kink easily and is easy to handle- enter the hypolon jacketed test lead wire- 18ga works fine. A Budwig center insulator (PL259 jack molded device) and a couple of ceramic insulators with nylon cord attached will do nicely.

The antenna described will outperform the outbacker by 20-30db minimum and is a lot more portable.

If you have to use the Outbacker, you will need resonant radials (at least 4 per band) for it to operate efficiently.

The dipoles need not be high to perform well- I have used at heights of 10' and they performed excellent.

>
>Paul
In the August "CQ" magazine on page #42 there is a excellent plan for a
2mtr. JPole. It is made of 300ohm twin lead simular to MFJs but cut to
compensate to be mounted in PVC pipe. It sports 3db gain across 2mtrs. with
low SWR (>1.2:1) and will transmit on 440 but the radiation angle is fairly
high for all but the closer repeaters.
Very good instructions make this design easy to build and the finished
product is around 4' and very easy to mount. One misprint is the top PVC
measurement. Instead of 43 3/8" it should be 44 3/8". My second cut of
pipe fit perfectly. The coax. mount calls for a SO-239 pass through socket
which is hard to find so I took a square panel mount and trimmed the corners
off to fit. Put a little coax seal around it before tightening and you have
a nice mount.
The performance was so good that I have 3 friends that have allowed me
to make them one. OK since the cost is only a couple of bucks.

Doug Freeman

2839. Tone board for a Santec ST-142

Newsgroup: rec.radio.amateur.misc
Date: 1994-08-19 02:53:12 UTC

I have a 10+ year old Santec ST-142 2m HT. It still works pretty well. I bought it back when I was in the Civil Air Patrol, before I got my ham license. I have a subaudible tone board in it, made by "Communications Specialists", I think. It is programmed by burning the codes for the tones into a chip of some sort, possibly a ROM. I've still got the programming board, which used a 12V power source.

Unfortunately, the tones programmed into it don't match any of the local 2m repeaters. The chip itself is marked M1-0198-S, and has an "H" logo in front of the number (Harris?). Does anybody know if that chip is still available? Does anyone perhaps have the single page of programming instructions for this board? Does anyone make another tone board for this make and model of HT? Thanks.

[...]
>keith@radio.nl.nuwc.navy.mil

If it has any plastic parts, be very careful. At the end of the wash, many dishwashers turn on a heating element that has ruined many a plastic article in ours. Since a HF rig is not something you casually put in the dishwasher and go watch TV, I suppose this is not too much of a problem to remember to remove it!

I would think that meters might suffer from leakage and water moisture build up.

But then again, as in some equipment, if you have nothing to lose, then why not. I know some people that have disassembled hard disks in their "non-clean" basements, and put them back into service successfully. So, who knows whether a gamble pays off or not?

Actually, come to think of it... why not put the TUBES in the top rack? Get them all nice and spiffy clean... they're least likely to suffer from it, assuming they can't move much!

- * -

I can just imagine what my XYL's reaction would be... opening the dish washer and pulling out the top drawer full of tubes (snicker)...
...then pulling out the bottom drawer with the old boat-anchor (rig) sitting on it!!!

Then the side tray where the silverware normally goes, I could leave my favourite pliers, screwdrivers, and open-end and box-end wrenches.

Ah... that would be fun... even if it meant the dog house for a week.
A Kodak moment... good footage for America's funniest videos.

Topic: What to do with your old ham books.

I have been cleaning out my shack trying to get organized for this school year (pictures of my room/disaster area are available on request). I bumped into my old copies of ham radio magazines, and books dating back to a few years. I began to wonder why I had subscribed to many magazines and purchased many ham books. The reason I came up was that it was mainly for reference about material for ham radio. Now that I don't need them that much anymore, I've been wondering what to do with it. Here are a few suggestion to you out there who are experiencing the same problem I did.
1. If you have a few magazines, try donating it to your local school or public library. Not many libraries in this nation can afford to subscribe to all magazines, and not many libraries even have library material relating to ham radio. The same goes for books. The last time I went to my local library, I found out that they still had an ARRL FCC Technician class license testing guide which expired sometime in 1982, and an ARRL manual dating back to the year of 1979 (I believe). Not many local libraries have up to date testing material in regards to ham radio.
2. If you have books to donate to your library, tell your ham club about it. An idea I picked up, when donating a book, was to have a page of information of the local ham radio club on the inside cover or on a page (such as an address or phone number). The message said, "If you have any questions about this book, contact the (Whatever) radio club at (555) 555-1212 (for example). This would make it easier for the reader to find out where to go locally to find a ham club.
Please take note, when you donate something either to your local ham club or library, please make sure that it is in a presentable condition. It is a good idea to get rid of the books you already used to prepare for your exam(s). For the past few years I have been licensed, I have yet to look up things in these exam booklets. But a handy book to have near by is a copy of the new FCC part 97, and an ARRL handbook (I just go to my library for the handbook). It is time to get good milage out of these used books, by donating them to your local library or ham club. This would allow others a chance to see what ham radio is all about,

without investing a few dollars to purchase the books (a great way to cut the spending down). I can guarantee that someone out there will want to read it. Finally, if you happen to see an out of date ham radio testing manual, please tell the librarian that the manual is outdated. This would prevent any future or prospective ham from studying the wrong test material.
Any questions, send me a message to my packet, e-mail or home address (available in the callbook). By the way, I'm accepting your experiences and suggestions about SAREX, fox hunting and how to get to a ham event without a car for future articles. And thanks to all who answered the survey I sent out earlier.

2844. Help please identifying a signal

Newsgroup: rec.radio.amateur.misc
Date: 1994-08-19 07:48:43 UTC
From: pbell@axion.bt.co.uk
Message-ID: <1994Aug19.064842.9423@lssec.bt.co.uk>
Source record: 261393
Cross-posted to: rec.radio.amateur.misc,uk.radio.amateur

Can anyone help me identify a signal please. During a meteor watch on 144.975 MHz I picked up two long bursts of an FSK morse signal between 19:39 UT and 19:42 UT Friday 12 August. It was 2 to 3 KHz high of my listening frequency. The signal consisted of 5 character groups of what appeared to be random letters. The data rate is quite high, much higher than normal practice transmissions.

I have checked my frequency calibration and that appears to be ok.

The signal was certainly FSK. At first I was puzzled because only the lower tone was easily audible. By playing with the tapes I was able to make the upper tone audible and hence render the signal readable.

The signal strength was quite good. Good enough in fact for my computer to detect it's presence and indicate it on a print out.

Allan Bell G6AXO

> from the UK?
> tnx Shel WA2UBK dara@physics.att.com
>

G3ULT is the call sign of the Reading And District Amateur Radio Club,
winners of the RSGB HF NFD in 1994, 1993, 1992, 1991 etc

The licence was taken to Jersey in February and operation took place
as GJ3ULT/P.

To QSL, you could either try one of the operators (fastest route)

John Linford, G3WGV,
Canberra Lodge,
Heath Ride,
Finchampstead,
Berkshire, UK

or route your card via the buro to G3ULT (slow)

I always feel ripped off by AEA. The upgrade price for the ROMS for the
PK232 is way out of line. It is only becasue they have that captive
audience. I really regret the purchase many times but I am stuck for now. I
will consider upgrade costs much more carefully the next time around. I think
75 bucks for two roms is WAY out of line and it has been more than that for
some. That is what it cost to gain only PACTOR.

2847. Handicap Hams

Newsgroup: rec.radio.amateur.misc
Date: 1994-08-19 10:35:30 UTC
From: t.wright@msuacad.morehead-st.EDU
Message-ID: <199408191041.DAA17886@ucsd.edu>
Source record: 261397

Do you know a Ham or a want-to-be Ham that has a handi-cap?
Well, I do. He is also a member of ARRL and his handi-cap is
that he is blind. I know that he has possably held a QSO with
a large bunch of brother and sister Hams all over the U.S. and the
world. Well, that isn't the problem.....

As a Blind Ham being an ARRL member he doesn't receive QST like
the rest of us who has been blessed with sight.

With the fall ARRL board meeting approaching, I would like all ARRL
members to write, call or talk to your SM's and Directors to make
QST available in an electronic format that they can either down load
or receive by S-Mail for their enjoyment. I know that I have enjoyed
reading the articles contained in QST and I know that the Vision Impared
Hams would like to enjoy those articles as well.

This electronic format must be made to where it can be read by a text
reader so it can voice out the words so that they can read QST with
their ears.

Join the call and contact the ARRL/Directors to start such a mediam
and maybe the other Amateur Radio related publications will follow
the ARRL's lead.

Thats all for now.

2848. Knife-edge diffraction and HF

Newsgroup: rec.radio.amateur.misc
Date: 1994-08-19 11:07:40 UTC
From: ega066@comp.lancs.ac.uk
Message-ID: <Cus48s.6wL@comp.lancs.ac.uk>
Source record: 261401

While there's plenty written about knife-edge diffraction, it's
mostly concerned with VHF-and-up propagation. As frequency
decreases, diffraction loss will decrease, which suggests that
at HF it wouldn't be too lossy a process. This would assume that
the diffracting obstacle is large in comparison with the wavelength,
but in many cases that shouldn't be a problem.

It seems to me that by appropriate location relative to an edge
it could be possible to get some vary low-angle radiation out,
without necessarily having to go up onto the edge (accepting
several dB relative loss), while using practical antennas.
If anybody has seen anything written on the subject with regard
to HF, has any thoughts as to why the theory falls down, or
otherwise, I'd be very interested to hear from them.

From: gilbaronw0mn@delphi.com
Message-ID: <9408190722591.DLITE.gilbaronw0mn@delphi.com>
Source record: 261398

I have a Cushcraft R7 antenna. It has never been satisfactory. It resonates on some bands and not on others. I have had several traps replaced but as soon as it fixes one band I have to get another trap for another band. I have it mounted 4 feet above my roof (no metal and nothing else within 40 feet) which Cushcraft claims can be a problem but that it should be adjustable. This week I got a new 12 meter trap because it would not even tune into any part of that band. It fixed 12 meters but now the lowest swr on 18 mhz band is 5 to 1. The 20 and 15 meter bands resonate way below the band edge. The 40 meter band works fairly well. Has anyone gotten this antenna to perform as advertised on all its' bands?
I must say Cushcraft has been pretty tolerant. The last trap was sent to me ups blue arrving yesterday and I have had the antenna for two years so they extended the warranty. The problem is that the great service is not a help if I can't get the antenna to function. I really have the feeling of a 350 dollar ripoff. HELLLLLLLLLLLLLLP please.

2852. Cushcraft R7. Does it work?

Newsgroup: rec.radio.amateur.misc
Date: 1994-08-19 12:02:31 UTC
From: gilbaronw0mn@delphi.com
Message-ID: <9408190802591.DLITE.gilbaronw0mn@delphi.com>
Source record: 261400

I posted a message earlier about my troubles with the R7. It is now working as it should and I think I will be happy. It turns out that the one I originally purchased had two bad traps. Not very good quality control. I have recieved these and have the antenna adjusted and it works fine on all bands. The marks, bad F-- for quality control but A++ for friendly service. It is a good thing too, I have moved and have no tower now so I need it on 20,15 and 10 badly.

2853. IC-745 MOD

Newsgroup: rec.radio.amateur.misc
Date: 1994-08-19 12:22:20 UTC
From: jwa@tellabs.com
Message-ID: <1994Aug19.122220.11571@tellab5.tellabs.com>
Source record: 261347

I tied to post this a few months ago but I'm not sure if it was sent.
For those of you that own IC-745's here it is again.

HERE'S HOW YOU CAN DOUBLE THE MEMORY ON YOUR IC-745

The following are excerpts from the WILLCO Electronics ICM-1024 NoFail memory installation manual for the IC-745

BEFORE YOU BEGIN
The following instructions may appear to be simple. They are, however, quite difficult to perform. If your not a qualified technician or if you don't have the proper tools or soldering skills, you can damage your radio. If you don't think you can perform the task, you should contact a friend that is qualified.

THE IC-745 32 MEMORY MODIFICATION
The following steps may require the green and white "Components Layout Sheet" and schematic that came with your Icom IC-745. You will be soldering wires directly to component leads, therefore, you will need a high quality temperature controlled soldering iron.

The IC745 was the first transceiver equipped with the EX-314 memory module using logic circuitry that is similar to the Icom R71 receiver (the R71 has 32 memories and the IC745 only has 16). The 16 memories are selected using a 4 bit binary rotary switch that's connected to DB0, DB1, DB2, DB3 and Y5. The 16 switch positions generate a count from 0 to F hex and is read by the microprocessor on the logic board.

The R71 receiver selects 32 memories using two 4 bit up/down counter IC's that are connected to the same data bus (5 bits from the two counters generate a count from 0 to 1F hex). On the R71 the fifth bit is connected to DB4.

The IC-745 32 memory modification requires the installation of a one switch and one diode. We recommend that you use the front panel PREAMP switch because it's close to the Matrix board (If the wires that connect to the Logic board are too long, they can radiate digital noise and interfere with the receiver). The switch will be used to select a second bank of memories by addressing the fifth bit (similar to the fifth bit in the R71 counters). The bank switch instructs the microprocessor to read new locations in the RAM memory. You can always add a rear mounted switch to control the pre-amp

PREPARATION
Disconnect the antenna and the AC or DC line power to the radio. Perform the work in a static free work space. You can also protect the radio by grounding it to a water pipe or a ground rod. If the wiring in your home or apartment is well grounded, the mounting screw on a duplex outlet is also a

good ground. Connect a jumper lead to ground with a 100k resistor in series and while doing the modifications, connect the other end of the clip lead to a metal watch band.

Remove the radio's top and bottom covers and place it up-side-down on a your work table. Remove the ribbon connectors that run from the Logic board (on the main chasis) to the Matrix board on the radio's front panel. The ribbon connectors are very delicate so be carefull when you un-plug them. Remove the four front panel mounting screws (they are located on the left and right side of the chasis.

Disconnect the existing wires that go to the PREAMP switch and reconnect them to an external or rear mounted toggle switch (the existing wires connect to a relay that switches the pre-amp in and out). Because they connect to the coil of the pre-amp relay, you don't have to worry about the wire length. The diagram below shows the memory switch connections to the Matrix board (it's located behind the radios front panel).

THE 32 MEMORY "MOD"
Connect the cathode end of a 1N914 (or equivalent) diode to J13 pin 2. Connect the anode side of the 1N914 diode to the switch. Connect the other side of the switch to J12 pin 5 or W13 on the Matrix board.

Now that the modification is complete you can remount the front panel and re-connect ribbon connectors. Mount the top cover. Make sure that radio is clear from tools and bare wires. Connect the radio to a power source and hook up the antenna. Turn on the radio. It should operate normally.

OPERATING INSTRUCTIONS
When you first power the radio, using the pre-amp switch, you can access a new bank of 16 memories. But first you will have to store new frequencies. Press the preamp switch and lock it in the down position.

Place the radio in the VFO mode and store your favorite "Ham" frequencies in the first memory. Store other frequencies in other memory locations. Place the radio in memory mode and rotate the memory switch. The frequencies that you stored should appear.
Press the pre-amp switch and unlock it in the up position. The old set of frequencies (that you stored before you made the "mod") should appear.

SCANNING
when all 32 memories are filled, the radio will scan all 32. All other functions should operate normally. Button up" the radio and enjoy!

>transliteration step.

I agree that using this method to achieve 1 minute solid copy is not exactly in step with the intent of the test. However, just sight reading your copy in order to answer the multiple choice questions seems to me to be a different matter. You put the information down in a form readable by you solely in order to answer questions about the content of the text. There's no reason your *notes* have to be readable by anyone else. My shorthand copy doesn't *look* like conventional dots and dashes. I doubt anyone else could make heads or tails of it. The same could be said for some people's handwriting. :-)

If it's allowed to copy *in your head* in order to answer the exam questions, and it is, then there's no reason to forbid a pencil and paper aid of whatever form for the same purpose. The important thing you're supposed to show is that you recovered the *content* of the text sufficiently well to answer the questions without the aid of a machine, IE you're supposed to *emulate* a machine for the purposes of the test. No one is concerned about the internal intermediate steps taken by a machine, so no one should be concerned about the intermediate steps you take emulating a machine. All that should matter is whether the *content* is output successfully.

2857. Whence QST?

Newsgroup: rec.radio.amateur.misc
Date: 1994-08-19 13:56:25 UTC
From: n2ayj@n2ayj.overleaf.com
Message-ID: <777304585.98snx@n2ayj.overleaf.com>
Source record: 261319

A while ago, the question arose about QST (the signal). I related that it
was a Made-in-Newington Q code because that was what I was told.
Then I received the following. I pass it along in the interest of accuracy,
and because I found it mondo interesting.

+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+
From Robert D. Keys, Assoc. Professor, Seed Research (NA4G)

QST is a standardized Q signal from the International Conventions dating
from around 1910 or maybe the 1912 conventions. It is used as:

QST "A general call to all stations"
QST IMI "Have you received the general call to all stations?"

It was widely used in the maritime services until the middle to late
1920's, but for some reason it is not listed in any manuals after about 1927.
It is listed in Irwin's RADIO from 1922, and in the US Army Training
Circular No. 522(?) of 1922, as an international Q signal

QST was borrowed by the ARRL as its logo for the magazine in 1915, starting
with the first issue, since it was the ham equivalent of a "general
call to all stations", in print.

I have been unable to find out why it is discontinued from the published
lists after about 1927.

They're all pretty good. I'd likely buy the same unit, a MFJ1270. It's cheap, the tin box is a good shield, it's TAPR compatible, it's cheap, I know all the tricks to make it work best, and it's cheap. The Tiny 2 is also good. It's TAPR compatible, it's small, and in the micropower version it has a low current draw. I'd avoid TNCs that weren't TAPR hardware and firmware compatible because I'd be locked out of too many useful third party add ons.

Actually, today I wouldn't buy a *TNC*. Instead I'd get an Ottawa PI card or a Gracillis card. I don't do 1200 baud anymore, and the internal cards handle higher speeds better than a TNC kludge dangling from a serial port. In fact, that's exactly what I do.

I have an HR-2A that I have used on packet. If you are in a marginal
signal-strength area or if there is any sort of interference, you
can expect to have problems. You may also have problems with
mic gain and modulation settings. It CAN be made to work with
adeqauute signal strength and some diddling.

Make SURE you get xtals in as tight a tolerance as you can
since the HR-2A doesn't have a receive netting adjustment.

Try JAN xtals and pay the extra for the higher tolerance.

Good luck.

>Thats all for now.

Isn't the ARRL part of the Talking Books program? I thought there were already audio cassette versions available. Perhaps not. I'd certainly like to be able to access QST, and the other ARRL publications, electronically, and I'm not very visually impaired (at least not yet). Having the ability to keyword search the text would make things much nicer, and keeping back issues would be less of a problem.

A presentation format would be a problem, what with diagrams and such being a large part of the technical articles. Perhaps an electronic publication standard is needed that would accomodate both the sighted and the visually impaired.

In Article <331c7b$8ol@geraldo.cc.utexas.edu> "kourt@foghorn.cc.utexas.edu.cc.utexas.edu (Kourt)" says:
> I've been playing around with my satellite program, and I would like to update
> the elements for all the satellites and for any others I can get my hands on.
> I have seen some of the uuencoded files on this newsgroup that appear to be
> amsat or nasa data files. Is this what I need?
>
> kourt de Haas
> austin, TX
>

Might be the wrong format, but a frequent posting in "rec.radio.amateur.space" gives "two line elements" for (more satellites than you are going to care about).

These are human-readable. The format is described about once-a-month if needed.

2863. Instructions for MACO Quad Antenna???

Newsgroup: rec.radio.amateur.misc
Date: 1994-08-19 15:20:42 UTC
From: swd_trb@afds.cca.rockwell.com
Message-ID: <CusFyI.KCx@lazrus.cca.rockwell.com>
Source record: 261409

Hello,

I have a MACO Quad 10-15-20 meters and have misplaced my assembly instructions.
Would anyone have a copy or know the name of the company that produced them?
(I seem to recall Springfield, Illinois somewhere in the instructions).

email would be cool
thanks
travis

2864. What's a 10-10 frequency?

Newsgroup: rec.radio.amateur.misc
Date: 1994-08-19 15:29:40 UTC
From: nimtz.1@nd.edu
Message-ID: <nimtz.1-1908941029400001@nimtziici.edmedia.nd.edu>
Source record: 261407

This morning I was listening to a conversation on 28.400 MHz. Two stations were talking then one of them said they should move off the frequency because it was a 10-10 frequency. He said he was going to move up to 28.450 and the other station could follow him if he wanted.

I've heard of the 10-10 "club" but what the heck is a 10-10 frequency? There is no mention of 10-10 frequencies in any of the ARRL literature or in part 97. Is there a new bandplan I don't know about? What happens if I call CQ on 28.4 MHz, will anyone answer me? What other frequencies are "off limits" because I'm not a member of some special club?

> Frustration is starting to set in, waiting for my license. [...]

While waiting for my license, my impatiance was only satisfied by continually banging away with a code practice oscillator. At the kitchen table, while in the car, while watching TV, (I was 15); it drove my parents and sister absolutely crazy. I think if my license had delayed another day in coming, my parents would have thrown me out.

Upon arriving home from school one day, there it was! I was officially WN6KHB. I zoomed right up to the shack (shared with my father, ex-W6RXR) and fired up the radio. It was 3:30 in the afternoon, and the only antenna we had was 80 meters. I called CQ for about 45 minutes without an answer - boy was that anticlimatic.

Fortunately, my enthusiam unstemmed, I returned at about 6 PM, and my CQ's netted my first contact with WN6GON. After about three more contacts (in about three hours of operating), I called it a night.

The log shows operation every night for the three first three months I was a ham.

The waiting period will eventually end, Ken. Now might be a good time to do some of those things you've been procrastinating, because with a ham radio in the other room, there's always something more fun to do than take out the garbage. :-)

Steve Bertsch N8KWV (sbertsch@magnus.acs.ohio-state.edu) wrote:
: Are there any stats, or even ballpark guesses, on how many folks are still
: interested in VHF modes other than FM, particularly 2 meter SSB? I may be
: able to pick up a 2 meter all-mode at a good price, but don't want to spend
: a chunk of $$ on an electronic nick-nack. I live in central Ohio, BTW.

Not surprisingly, it seems to depend on where you live. In Mass, PA, or NJ,
big multioperator contest stations find around 600 different SSB stations
to work on 2 meters. But since even SSB has a typical range of under
300 miles for many stations, it is entirely possible to live
in areas with little activity.

2 meter SSB is used for 10 GHz liasion work in the Northeast--144.260 MHz.
FM is just too crowded to work well when you are on a big hill and can
see 6 or 7 states :-). Last year, even with a 25 watt amp, I needed to
switch to CW to set up a 10 GHz schedule over a 500 km path. Anyone
suggesting I use DSP techniques is invited to carry the equipment up and
down the hiking trail (this Sunday its Grand Manadnock--2.2 miles to the
summit with 1700 ft of elevation gain). Actually, I do bring FM along to
accomodate those with WBFM rigs and HTs, but finding a good frequency is
a real challenge.

2 meter SSB is also the basis for a lot of satellite work--both now and
with Phase IIID. Even if you plan to operate microwaves, chances are
that you want an 2 meter SSB receiver and transmitter to work satellites for
use as an IF rig. True, 70 cm and 23 cm make more sense on 10 GHz, but
the reality is that most people are using 2 meters as the IF up through
10 GHz.

Source record: 261414

Hi to all in net-land. I have a 1989 Honda GW Aspencade and would like to at least put a 2M mobile on it. Later maybe a TenTec Scout or some other HF rig.

Presently, the choice is 2M and would like to know what others have done to make a sanitary installation. I will probably use my Icom 229H or find some other rig that is not quite so desirable.

The main question, however, is what to use for an antenna. I don't have a large metal roof to mount it to, so will have to use an antenna different than I am familiar with. What would be the desired mounting choice? I have thought about buying a trailer hitch for the bike and maybe even tow a small trailer at sometime. It may be possible to mount some sort of a whip to the trailer mounting bracket...???

Any and all ideas appreciated..... If I get enough suggestions, I will make a list of what I received and send it out to the world.....

73/Bill/N6GHG..... Hopefully motorcycle mobile in the near future...

I'd like to see this list electronically somewhere, even if I did
have to pay for it. For example, when the 2m band opened the other
night, I was hitting repeaters all over the place. I'd like to have a
comprehensive list so that all I had to do was punch in a frequency
and I'd get back all the repeaters on that freq. It's a lot easier
than thumbing through umpteen pages of listing (esp. if you're in a
hurry).

Having lat/lon with each listing would be nice too, for making your
own maps, figuring direction to the repeater, etc.

Is there such a list compiled by someone, free or otherwise?

ARLP034 Propagation de KT7H

ZCZC AP48
QST de W1AW
Propagation Forecast Bulletin 34 ARLP034
>From Tad Cook, KT7H
Seattle, WA August 20, 1994
To all radio amateurs

SB PROP ARL ARLP034
ARLP034 Propagation de KT7H

Solar activity is low. Geomagnetic activity has been up a bit,
peaking with an A index of 26 on August 14. Solar flux should stay
around 80 for the next month, but there will be a slight peak near
85 around August 23 through 28. Geomagnetic conditions may become
unsettled again around September 8 through 10.

Low solar activity means that the Maximum Usable Frequency will be
low over most paths. 20 and 30 meters are probably the best overall
bands for long distance communication.

Sunspot Numbers from August 11 through 17 were 37, 58, 59, 75, 61,
64 and 73, with a mean of 61. 10.7 cm flux was 76.7, 80.8, 84.5,
88.9, 81.4, 77 and 78, with a mean of 81.

The path projection for this week is from Jacksonville, Florida to
Chad.

80 meters should be open from 0000 to 0445z, peaking around 0100 to
0130. 40 meters looks good from 2300 to 0530. 30 meters looks best
from 2200 to 0300, and may possibly open again around 0500 to 0600.
20 meters should be open from 1930 to 0100. On many days, 17 meters
should be open from 1600 to 2300, and on a few days 15 meters may be
open around 1830 to 2030. 12 and 10 meters do not look good over
this path at this time.

For those who are keeping score...

I mailed my 610 for a simple renewal (no call change, no address change, etc) directly to Gettysburg on July 18. My new license is effective August 15, was postmarked August 17, and arrived today, August 19. The new effective date is exactly 4 weeks from my 610 mailing date.

Just makes you wonder, how much more work can it be to issue a new license vs. process a renewal? 17 weeks vs. 4 weeks? I guess there are just less applications in the renewal pipeline and they push them right through...

Well now I am good for another 10 years :-)

2880. Book Review: LATEST INTELLIGENCE reference for radio/scanner fans

Newsgroup: rec.radio.amateur.misc
Date: 1994-08-19 22:15:40 UTC
From: mc@shore.shore.net
Message-ID: <333auc$4o4@shore.shore.net>
Source record: 261329
Cross-posted to: rec.radio.scanner,alt.radio.scanner,rec.radio.amateur.misc,rec.radio.shortwave

I am always intrigued by "secret information" books and when I noticed LATEST INTELLIGENCE by James E. Tunnell (TAB Books division of/McGraw Hill 1990, ISBN 0-8306-3531-9, $16.95) I just had to read it.

LATEST INTELLIGENCE describes itself as "an International Directory of Codes by Government, Law Enforcement, Military and Surveillance Agencies. Its a concise directory covering communication codes, radio frequencies, descriptions and explanations. It's absolutely fascinating!

The meanings of more than 35.000 terms, phrases, abbreviations and acronyms used in the intelligence, law enforcement, military and aeronautical communities have been compiled into one convenient, well-indexed volume. LATEST INTELLIGENCE was compiled with the assistance of the U.S. Department of Defense, INTERPOL, NASA, law enforcement and intelligence groups in America,Asia and Europe.

Stated objective of the book is "to provide fundamental information on subjects discussed in law enforcement, military and government radio communications". Topics range from radio codes used by law enforcement agencies to street slang for narcotics. A directory of worldwide law enforcement agencies is included.

Some of the "goodies" include:

* Amateur radio callsign prefixes (although these are somewhat dated, especially in regards to the former Soviet Union and its republics.)

* TV Audio frequencies including UHF translator channels and RCI sub-carriers.

* International Civil aircraft markings/identifiers.

* Cellular phone frequencies (both cellphone and repeater site) although for some unknown reason these are listed under Emergency Cellular Telephone Frequencies and they do not include the extended cellular band from 869.030 to 970.000 MHz.

* Worldwide emergency/distress and search-and-rescue frequencies.

* Federal law enforcement frequencies, including a comprehensive list of Immigration - Border Patrol

* Fire 10-codes.

* Traffic "prowords" and Q signals.

* Security clearance basics.

* Lists of sources of information on how and where to buy government surplus materials. This info alone is well worth the price of the book!

* Repeater frequencies used by Highway Patrols.

* Social Security Numbers codes decoded.

* Law Enforcement 10-codes (lists several meaning for each 10-code so this can be very confusing).

* List of U.S. Military Bases, Stations and related installations worldwide.

* comprehensive bibliography and list of resources.

and a whole lot more......

Overall my impression of this book is that it is very useful as a reference to general radio monitoring. My criticism is that it is somewhat dated (1990) although most of the information is still current. I was somewhat amused by the author's definition of a "Johnson" (street slang for a stolen vehicle). My knowledge of this word used in this context is something quite different). I noticed several errors (but these are bound to occur especially in a work that contains so much information.)

LATEST INTELLIGENCE has been prepared as a ready-reference guide to short-wave radio and scanner listening. It bills itself as "the most comprehensive and up-to-date communications tool you can have on your bookshelf." It has been placed in a prominent position on mine!

Michael Crestohl, KH6KD/W1

Thanks for the info.

Well, that's a vast improvement on it compared to when I started out as an SWL at high school. It had an ident in voice every 30 minutes, and a code by which one could pick the time each minute - I never learnt what it was. :)

I know the Gov't gave up the ghost on VNG a few years back, then the Navy filled in with a time signal which couldn't be guaranteed to be there from one day to the next (due to operational reasons), and then the VNG user's group took up the challenge and resited the service to LLandilo (Sydney). I believe that at one time they were on 10 MHz, and luckily they moved it - we couldn't hear WWV!

Greater than 2 MeV Electron Fluence for 16 AUG is: 5.6E+08

SYNOPSIS OF ACTIVITY

Solar activity was low for the past 24 hours. A single
C-class x-ray event occurred at 1327Z (max) but no flare report
was received. Region 7765 (S11W37) was the likely source
because it produced several subflares through the day, many
with x-ray enhancements. Region 7765 continued to decline in
white light and magnetic complexity. New Region 7767 (S13E47)

emerged as a simple, bipolar spot group. The remainder of the disk and limbs were quiet.

Solar activity forecast: solar activity is expected to be low to very low. Region 7765 now appears capable of only isolated C-class x-ray events.

The geomagnetic field has been at quiet to unsettled levels for the past 24 hours. Energetic electron fluxes at geosynchronous orbit were high.

Geophysical activity forecast: the geomagnetic field is expected to be active tomorrow based on a possible solar wind disturbance associated with a moderate x-ray event on 14 August. Quiet to unsettled conditions should prevail for the remainder of the forecast period.

Event probabilities 17 aug-19 aug

Class M 20/10/05
Class X 01/01/01
Proton 01/01/01
PCAF Green

Geomagnetic activity probabilities 17 aug-19 aug

A. Middle Latitudes
Active 45/55/20
Minor Storm 20/10/10
Major-Severe Storm 10/05/05

B. High Latitudes
Active 45/55/20
Minor Storm 25/10/10
Major-Severe Storm 10/05/05

HF propagation conditions were normal over all regions. Periods of minor signal degradation were evident at times over the high latitude regions. Equatorial paths also reported periods of minor signal degradation attributed to sporadic absorption in the night-sectors. Similar conditions are expexted over the next 72 hours. There is a chance the flare-related disturbance of 14 August could impact with the Earth over the next 24 hours. If it fails to arrive, near-normal propagation will continue. There remains a risk for minor SWF activity due to solar flares, although the threat is gradually decreasing as Region 7765 decays.

Just to add a note to Eric's advice ...

I'm currently in the UK and my licence application is in progress.

I had to send the following to SSL:

a) My application form (mine came from RadCom).
b) My original VK licence.
c) My cheque drawn on a UK bank for GBP 15.00.

SSL replied within a week (to my address within the UK) with my original VK licence, and a note saying that they acknowledged receipt of my application. They also ask that I allow 21 days for the receipt of my callsign and validation document. The bit I liked was the request that I *not* contact SSL during the 21 day period with concerns about the issue of my licence! :)

I think I'll just wait for it to turn up in the post ... :) it should turn up in about two weeks time!

I considered applying for a licence before I arrived here, but found that upon arrival I was so busy getting used to a different country that my first 21 days flew by, and I could have had a licence by the time I remembered that I still even had a radio packed away in the luggage somewhere! (As you've probably gathered, I'm not in a tearing great hurry to get on the air).

Hope you don't want to do any serious HF if you'll be in suburbia at all ... there's not a lot of space over here. I've not seen too many back yards big enough to put in a decent half-wave dipole on 20 metres, let alone a three element tri-band yagi. :)

Many of the larger repeater coordination groups copyright their listings,
so they can't be reproduced (legally) without written consent, which they
would probably want $$$ for. Similiarly, the ARRL repeater directory is
copyrighted, so it can't be reproduced either.

If there were an easy way for Internet users to submit repeater information,
such as an on-line application, I bet a fairly decent list could be
assembled in a short amount of time. Over the past 9+ years of being
on the 'net, I think I've seen about a dozen attempts at compiling such
a list, but it was always via email forms, which creates a lot of work
for the person on the receiving end.

Greater than 2 MeV Electron Fluence for 17 AUG is: 4.9E+08

SYNOPSIS OF ACTIVITY

Solar activity was moderate. Region 7765 (S12W52) grew in
area and magnetic complexity. This region produced an M1/1N
flare at 17/0111Z and two C-class flares.

Solar activity forecast: solar activity is expected to be
low. Region 7765 has M-flare potential.

The geomagnetic field has been at quiet to unsettled
levels for the past 24 hours. The greater than 2 MeV electron
flux was high at geosynchronous orbit altitudes.

Geophysical activity forecast: the geomagnetic field is
expected to be unsettled. High latitude stations may record
brief active periods due to night-time substorming.

Event probabilities 18 aug-20 aug

Class M 25/25/25
Class X 01/01/01
Proton 01/01/01
PCAF Green

Geomagnetic activity probabilities 18 aug-20 aug

: I think the claims are an understatment. :-)

Then follows the miricle story about trying to learn code since
1965 (!!!!!) and doing it with the abovementioned tapes in 3 months...

Well - this sounds a little strange - thus I'd like to hear
some comment about HOW this is achieved - i.e. what is on the tapes,
how you use it. And if someone else have used it I'd appreciate a
comment.

I did pass my 5wpm after ONE week of training with morse804 program.
So I really don't understand the 1965 story - I mean it took me about
a few months to learn typing - and because the posted letter was typed -
I wonder how this could be...

Thank you,
Vassili, N2WID.

2888. Cushcraft R7. Does it work?

Newsgroup: rec.radio.amateur.misc
Date: 1994-08-20 00:08:51 UTC
From: jracz@phoenix.phoenix.net
Message-ID: <333hij$4n0@dolphin.phoenix.net>
Source record: 261337

I've had my R7 for more than 3 years now. It went together without any problems and I've had no problems tuning it on all advertised bands. I also have 3 other friends who have invested in the R7 and had no problems with it's construction or tuning. I also have a friend with an R5 who reports the same good results. The only complaint that I have with my R7 has nothing to do with the antenna or with Cushcraft in general. On 40 meters, there is a lot of man-made noise in the vertical orientation. I have just as good results with far less noise on my 40 meter dipole as I do my R7. Since 30 meters is not one of my favorite bands, I regret not purchasing an R5 instead of an R7 and pocketing the $100 difference (or investing it in some other equipment).

2890. Amazing but true

Newsgroup: rec.radio.amateur.misc
Date: 1994-08-20 00:22:22 UTC
From: shopson@netcom.com
Message-ID: <shopsonCut51v.4HL@netcom.com>
Source record: 261344

I took my Tech test on July 9, 1994

Today is Aug. 19, 1994 and what came in the mail, my new call sign
of course.

I'm officially on the air as KE6LLO....

Everyone else I've spoken to said that it took from 12-14 weeks
to get the ticket back and here's mine in the six weeks promised.

Either the FCC has hired a few more people , or miracles still happen...

: Can you 6M U.S. coast to coast?
: If so, how much power and what antenna type is best?

Most of the time no amount of power or antenna will work. But during times of good propagation, modest stations will work coast to coast.

A month ago several of us in the Berkeley Hills of California were able to work a Hawaiian 2meter repeater with a one watt handheld using a rubber-duck antenna. This was due to tropospheric ducting, a weather related propagation mechinism. Again, normally no amount of power or antennas will work over this 2500 mile path.

Bob

FOR SALE:
2 Uniden 800 MHz Trunking Hand Held Radios
Model Number FPS 820TS with one NEW battery
and 2 Rapid chargers.

Make me an offer via i-mail durbin@vm1.nodak.edu
or phone after 6pm (701) 599-2470 (JOEL)

Thanks

2893. Questions: Digital Scanning, Cellphones, Transmissions

Newsgroup: rec.radio.amateur.misc
Date: 1994-08-20 01:43:25 UTC
From: g9153402@huey.csun.edu
Message-ID: <333n3t$jqf@nic-nac.CSU.net>
Source record: 261346
Cross-posted to: rec.radio.scanner,rec.radio.amateur.misc,rec.radio.amateur.policy

Questions I have:

I've heard that digital cellular telephone transmissions will eventually be the standard in the future, since it has higher capacities, and the like, and any cellular scanning would probably not work.
First, does anyone know when this will come, or even equal 50% of such calls? Digital cell phones are very expensive, when compared to the regular models, which are literally being given away. Many stores (like Office Depot) I haven't seen even stock digital phones. With people still buying the regular ones in huge quantities, and ignoring the digital ones, which when adding the price of the phone to the onerous monthly cellular rates, represents quite a huge investment, I don't see digital service being the standard at least until the turn of the century. The costs are too high, as many people will just settle for the analog models, even though the sound quality may be less, since they may not use them that often (many just have cell phones for emergencies, or urgent uses). Even sellers of cellular service, just push the cheap phones, since their profits are very little on the phones, but huge on selling those one and two year cellular service contracts. Those analog phones have become almost disposable, with less worry about losing or breaking them. Not so, with the digital ones.
But if, and when, digital services become the standard, will that make our scanners next to worthless, with nothing left to scan? What does a digital transmission sound like on a scanner? If it's when my scanner stops on a channel that's just a steady noise, I think I know what it is. Will more and more of this stuff just flood the radio spectrum, making scanning a pain in the neck? And if digital becomes a standard, will there be a new generation of 'digital scanners', able to detect digital, and translate it. If that becomes the case, there would have to be some digital transmission standard, or else it wouldn't work. I would guess scanning, and cellular scanning, would become more difficult, but not any time soon. But if cellular digital becomes the standard, I see some smart individuals building scanning devices that incorporate a circuit taken out of a digital cell phone, that can still scan this stuff.

Any answers to the above???

No they don't. NEW equipment costs that much. I have an IC-211 that I
got less than 6 months ago and it cost me $225 and it is in great shape.
It only puts out 10 Watts but a linear will take care of that problem.
Look around, there are good deals to be had if you know where to look!
73 and see you on VHF SB.

Let me just suggest you get ahold of a ham in your area for help and you will find that most all hams will be very, very helpful in getting some-one started. Good luck and I am sure it will not be something you will be sorry you did. It's a great experience. Good Luck
De Sonny Ka1esg in New Bedford, Mass.

>Also, if Tropical storm Chris hits land, what nets down in Florida at

There usually isn't much activity when a storm is days away from any land
area. It will pick up quickly if/when a storm nears land. Here's the
info on net freqs:

NOTE: The Effective Sunspot Number for 17 AUG 94 was 23.0.
The Full Kp Indices for 17 AUG 94 are: 2- 3- 3+ 2- 2- 2- 1+ 1o
The 3-Hr Ap Indices for 17 AUG 94 are: 7 13 19 7 7 6 5 4
Greater than 2 MeV Electron Fluence for 18 AUG is: 3.9E+08

SYNOPSIS OF ACTIVITY

Solar activity was moderate. Region 7765 (S11W65)
stabilized and produced an M1/1F flare at 18/0258Z. It is the
probable site of another M1 flare at 18/1501Z. Region 7768
(S13E28) and Region 7767 (S12E20) grew steadily during the
period.

Solar activity forecast: solar activity is expected to be
low. Region 7765 still has M-class flare potential but seems to
be in a slow decline.

The geomagnetic field has been at quiet to unsettled
levels for the past 24 hours. Greater than 2 MeV electron
fluxes at geosynchronous orbit were high.

Geophysical activity forecast: the geomagnetic field is
expected to be unsettled due to the intermittent M-class
flares.

Event probabilities 19 aug-21 aug

Class M 25/15/05
Class X 01/01/01
Proton 01/01/01
PCAF Green

Geomagnetic activity probabilities 19 aug-21 aug

A. Middle Latitudes
Active 20/20/20
Minor Storm 10/10/10
Major-Severe Storm 05/05/05

B. High Latitudes
Active 20/20/20
Minor Storm 10/10/10
Major-Severe Storm 05/05/05

HF propagation conditions were near-normal over all
regions. Brief SWFs could have been observed. The first SWF
near 03:05 UTC could have affected regions of eastern and
central Asia including Australia, New Zealand, and Japan. The
second SWF at 15:11 UTC could have affected almost all of North
and South America, Africa, and Europe. Reported SWFs were
relatively brief and minor. Effects would have been strongest
on transatlantic paths. Near-normal propagation is expected to
continue over the next 3 days, through 21 August inclusive.
There remains a decreasing risk for additional minor SWFs
before Region 7765 rotates behind the west solar limb on
21/22 August.

NO EVENTS OBSERVED.

NOTES:
All times are in Universal Time (UT). Characters preceding begin, max,
and end times are defined as: B = Before, U = Uncertain, A = After.
All times associated with x-ray flares (ex. flares which produce
associated x-ray bursts) refer to the begin, max, and end times of the
x-rays. Flares which are not associated with x-ray signatures use the
optical observations to determine the begin, max, and end times.

Acronyms used to identify sweeps and optical phenomena include:

II = Type II Sweep Frequency Event
III = Type III Sweep
IV = Type IV Sweep
V = Type V Sweep
Continuum = Continuum Radio Event
Loop = Loop Prominence System,
Spray = Limb Spray,
Surge = Bright Limb Surge,
EPL = Eruptive Prominence on the Limb.

>
>I've heard something interesting yesterday on one of the local repeaters. A person used the phone patch and got placed on hold. The place he called had music on hold and someone came on the repeater and told him to hang up because playing music is illegal.
>
>I guess if you follow the letter of the law it is, but I would think this is kind of a grey area. Your not playing the music although your ticket is responseable because your the one initiating the call. Just that today music on hold is not uncommon and if phone patches are legal, then the FCC rules may need to be changed slightly.
>
>I'm curious what others think about this.

I'm sure it's illegal, and it should be immoral and fattening as well considering the saccharine pap they play. The person whose license is in jeopardy is the trustee of the repeater, because it's his station transmitting the music. This is doubly illegal because it's transmission of music, and because the "music" most businesses use is obscenely bad music. (There's no Twisted Sister, no Black Sabbath, not even any Whitesnake, how can they call the dreck they play music?) When the FCC relaxed the no business rule, they opened this can of worms. The correct thing to do, on the repeater, or on a landline, is when you hear music on hold, hang up immediately. I always do.

2902. Re: Repeater Autopatch

Newsgroup: rec.radio.amateur.misc
Date: 1994-08-20 12:20:18 UTC
From: "Ron St.Denis" <rstdenis@delphi.com>
Message-ID: <5K-ytaq.rstdenis@delphi.com>
Source record: 261357

Ken....

The repeater groups that I belong to have both issued very
clear instructions to hang up "immediately" if placed on hold with
music in the background. Personally, I wouldn't tie up a repeater
while waiting for someone on the other end to take the time to talk
to me. To begin with, the use of an autopatch set up is really
intended for calls that "can't" be made by another means and surely
not for business related calls, so, I really don't think that this
is really a gray area. Remember two things when useing any repeater...
someone else is ALWAYS listening and you're not the ONLY person that
needs or wants to use it. If you keep these things in mind at all
times, you'll be regarded as a courteous operator... something that
we should all strive for...!!!!

>Questions I have:
>
>I've heard that digital cellular telephone transmissions will eventually
>be the standard in the future, since it has higher capacities, and the
>like, and any cellular scanning would probably not work.

Yep.

>First, does anyone know when this will come, or even equal 50% of
>such calls?

The providers are planning on having a 50% changeover in four years.
Digital phones will allow them to service many more customers with
the same cell sites. They have a big incentive to convert as rapidly
as possible.

>Digital cell phones are very expensive, when compared
>to the regular models, which are literally being given away. Many
>stores (like Office Depot) I haven't seen even stock digital phones.
>With people still buying the regular ones in huge quantities, and
>ignoring the digital ones, which when adding the price of the phone
>to the onerous monthly cellular rates, represents quite a huge
>investment, I don't see digital service being the standard at least
>until the turn of the century. The costs are too high, as many
>people will just settle for the analog models, even though the sound
>quality may be less, since they may not use them that often (many
>just have cell phones for emergencies, or urgent uses). Even sellers
>of cellular service, just push the cheap phones, since their profits
>are very little on the phones, but huge on selling those one and
>two year cellular service contracts. Those analog phones have become
>almost disposable, with less worry about losing or breaking them. Not
>so, with the digital ones.

Actually, the digital phones are *cheaper* to produce than good analog
phones. The prices are high now only because they haven't ramped up
production. The final standard hasn't been chosen and cell sites haven't
been converted. When they start cranking them out in the quantities that
they are making analog phones, prices will plummet. And, as now but
even more so, the service providers will subsidize the cost of the
phones to encourage customers to switch over. Note too that the
providers are primarily interested in the heavy business users of
cellular phones. That's where the money is, with high monthly usage.
If they cut off some customers who don't use the service much by
shutting down the analog nets, they won't cry about that. There's

no universal service mandate for cellular.

>But if, and when, digital services become the standard, will that make
>our scanners next to worthless, with nothing left to scan?

It's illegal to scan cellular *now*, you're supposed to use your scanner
to scan transmissions that are legal to intercept such as unscrambled
public safety and amateur.

>What
>does a digital transmission sound like on a scanner? If it's when my
>scanner stops on a channel that's just a steady noise, I think I know
>what it is. Will more and more of this stuff just flood the radio
>spectrum, making scanning a pain in the neck?

Absolutely. Digital is the wave of the future. Eventually, public
safety and commercial land mobile will go digital too. The era of
electronic voyeurism will come to an end.

>And if digital becomes
>a standard, will there be a new generation of 'digital scanners', able
>to detect digital, and translate it?

No. Intercepting cellular calls is illegal now, there won't be scanners
legally sold to decode digital cellular in the future unless the ECPA
is repealed (very unlikely).

>If that becomes the case, there
>would have to be some digital transmission standard, or else it wouldn't
>work. I would guess scanning, and cellular scanning, would become more
>difficult, but not any time soon. But if cellular digital becomes the
>standard, I see some smart individuals building scanning devices that
>incorporate a circuit taken out of a digital cell phone, that can still
>scan this stuff.

It's possible. The methods proposed are intended to facilitate transmission,
not primarily as an encryption method. However, it won't necessarily be
simple. There are two methods competing for digital cellular. One is based
on TDMA, and the other is spread spectrum. Since with SS each phone will
have it's own spreading sequence keyed to it's serial number, you'd have
to try millions of combinations to luck onto the correct one for a given
phone. If TDMA is chosen, you'll have to break the supervisory circuit to
track the time slice as the phone hops from cell to cell. And all of this
would be very illegal of course.

Gary

>to the trailer mounting bracket...???

Maybe a visit to the local police station (or the donut shop <g>) would be in order. The police bikes are radio equipped, and they seem to be able to transmit and receive OK. See what they use. Although the trend is towards UHF for big city PDs, many used to use VHF and many still do. As I recall, an end-fed 1/2 wave dipole (approx. 38 inches for 2m) requires no ground plane to operate. Perhaps using one of those "extra range" telescoping antennas they make for the handhelds would work. An L bracket with a BNC connector in it should do the trick for mounting.

The Full Kp Indices for 18 AUG 94 are: 0+ 1+ 2- 3o 2+ 2o 2- 3-
The 3-Hr Ap Indices for 18 AUG 94 are: 2 5 7 15 10 8 6 11
Greater than 2 MeV Electron Fluence for 19 AUG is: 1.8E+08

SYNOPSIS OF ACTIVITY

Solar activity was at moderate levels. A M1/SF flare
erupted from Region 7765 (S09W67) at 19/0258UT, which is
approaching the limb. Region 7767 (S12E06) has shown rapid
growth and is as bright as Region 7765.

Solar activity forecast: solar activity is expected to be
mostly at low levels. Region 7767 has potential for producing
an M class flare.

The geomagnetic field has been at quiet levels for
the past 24 hours.

Geophysical activity forecast: the geomagnetic field is
expected to be at quiet levels.

Event probabilities 20 aug-22 aug

Class M 35/25/10
Class X 01/01/01
Proton 01/01/01
PCAF Green

Geomagnetic activity probabilities 20 aug-22 aug

A. Middle Latitudes

Major-Severe Storm 01/01/01

B. High Latitudes
Active 20/20/20
Minor Storm 10/10/10
Major-Severe Storm 05/05/05

HF propagation conditions were near-normal over all
regions. A brief short-wave fadeout may have been associated
with todays M-class flare, and may have affected regions of
eastern Asia, including all of Japan, Australia, New Zealand
and the East Indies. Normal propagation will continue
throughout the next 72 hours, through 22 August inclusive.

EVENTS WITH SWEEPS AND/OR OPTICAL PHENOMENA FOR THE LAST UTC DAY

Date Begin Max End Xray Op Region Locn Sweeps/Optical Observations
------ ---- ---- ---- ---- -- ------ ------ ---
NO EVENTS OBSERVED.

NOTES:
All times are in Universal Time (UT). Characters preceding begin, max,
and end times are defined as: B = Before, U = Uncertain, A = After.
All times associated with x-ray flares (ex. flares which produce
associated x-ray bursts) refer to the begin, max, and end times of the
x-rays. Flares which are not associated with x-ray signatures use the
optical observations to determine the begin, max, and end times.

Acronyms used to identify sweeps and optical phenomena include:

II = Type II Sweep Frequency Event
III = Type III Sweep
IV = Type IV Sweep
V = Type V Sweep
Continuum = Continuum Radio Event
Loop = Loop Prominence System,
Spray = Limb Spray,
Surge = Bright Limb Surge,
EPL = Eruptive Prominence on the Limb.

2906. General Class Exam Question Pool

Newsgroup: rec.radio.amateur.misc
Date: 1994-08-20 16:01:41 UTC
From: davesparks@delphi.com
Message-ID: <9408201200591.DLITE.davesparks@delphi.com>
Source record: 261360

Please forgive me if this message is a duplicate. I attempted to post it earlier, and I'm not sure it ever got out:

I have an ARRL study manual for the General Class that's a couple of years old. It states on the front cover "For exams given at least until June 1994". Apparently 7/1/94 was the EARLIEST date that the question pool might be changed. Does anyone know what the status is? Are the old questions still good, or have they changed? If they haven't changed, has it been announced when they will change? Similar info for the Advanced pool would be helpful, also. Thanks.

BULLETIN 340 MGT: Solving the Impossible 2/2
Release Date: August 22, l994

Emergency services administrators not yet using volunteer communicators may well wonder if such dedicated and reliable volunteers actually exist. They do, although they may not necessarily be the first group that comes to mind. In many parts of the country such people have been found and selected carefully from a pool of applicants, and then trained and employed for many years. The key elements are: selected with care and trained and employed for years.

While only a small percentage of the potential emergency communications reserve participants will have the dedication and meet the requirements to become truly professional emergency communicators, there usually are sufficient numbers. Once selected, organized and trained, they can become largely self-sustaining so long as the agency remembers to keep them actively involved in the day-to-day life of the agency.

That is, in itself, one of the essential actions that separates outstanding results from the mediocre for the agency. It is a process that is far easier to implement than to describe.

The effort required to establish a communications reserve assuredly will pay off. Check into the services that have dealt with recent disasters, such as the hurricanes in South Florida and Hawaii, earthquakes and fires in Southern California, floods in the Midwest. Volunteer communicators were indispensable in all of them.

Need help in finding such personnel? Help IS available to the agency that asks for it. Call Stan Harter or Cary Mangum

^^^^^^^^^^^^^^^^

Classic! The following may be a bit off the track of the thread ... I'd like to respond to / concur with the above.

When I was in my final year at university I did a radio project for my major project. My lecturer / supervisor was a Ph. D. who could have passed any ham theory paper in his sleep. But, he'd never bothered to become licenced. We were talking about ham radio one day when he said that around the time he could have become a ham he discovered girls. Next, he came out with this gem:

"I could never figure out if one needed the personality hang-up first to get a licence, or if one got it after one was licenced." :)

I *really* had to agree with him ... however, I don't think ham radio is the only repository for such people. It has become more so over the last 10-15 years due to the CB radio boom, and the relaxed licensing conditions. No, I'm not attributing this on CB'ers -CB for many people is a conduit for entry into ham radio -even if they don't know it when they give their first "10-4 good buddy" sign-off.

Unfortunately, it appears that the general public (from whom we will need support in order to keep our hobby in the 2000's) only see the wierdo's, i.e. the geeks and loners described above. A friend of mine once listed a basic set of personal attributes by which he could pick a ham from any line-up - this came from years of meeting people at WIA meetings! I won't list them here ... And it certainly doesn't help our image when a non-ham friend visits the shack and overhears a QSO: "Sure, _old_man_ you're 5 by 9 plus 20 ...". The "5 x 9 + 20" bit I can explain satisfactorily, but I sure have difficulty with the "old man" bit. Or, you switch on 40 m HF in the morning and hear the daily round of people going on ad-nauseum while describing their medical problems! The usual response from the non-ham is [fx: incredulous voice] "And you _talk_ to people like _him/her_?".

Today, the typical "ham-type" can also be found playing with computers, spotting trains, watching birds, etc., etc. (It's common knowledge that many computer types would actually be hams if they'd been born 30-40 years earlier.) In general, these people will be attracted towards *any* leisure occupation in which one spends most of one's time *physically* isolated from

others. Try this one on yourself: ever tried sharing a shack with another op? :)

Despite the above, I feel that I'd rather be a ham - and have some knowledge of one aspect of technology that's driving the world today - than be an ignorant "user". Look at what one learns as a ham - facts about other peoples and other places, i.e. the world in which we live. Ham radio can be like death and taxes: it's a great leveller, as you cannot be prejudiced about the other op - you don't know what he/she looks like, what religion they follow, who they vote for (if they *have* the vote), who they work for, etc. For some people, ham radio provides an extremely useful social activity and a release from circumstances beyond their control -look at how many "white stick" and "wheelie" ops we have on air. For others, what starts as a hobby can even lead to a career.

Will a resistor of approx. 10 times the magnitude of the feed point impedance
help as a static bleed? Connect it between the antenna base and a ground
stake. It won't survive lightning, but it might help eliminate that 10
seconds when your receiver is busy discharging the antenna.

: Geoffrey S. Mendelson (gsmlrn@gsm001.mendelson.com) wrote:

: : I think the claims are an understatment. :-)

: Then follows the miricle story about trying to learn code since
: 1965 (!!!!!) and doing it with the abovementioned tapes in 3 months...

: Well - this sounds a little strange - thus I'd like to hear
: some comment about HOW this is achieved - i.e. what is on the tapes,
: how you use it. And if someone else have used it I'd appreciate a
: comment.

: I did pass my 5wpm after ONE week of training with morse804 program.
: So I really don't understand the 1965 story - I mean it took me about
: a few months to learn typing - and because the posted letter was typed -
: I wonder how this could be...

It's simple. Some people think in a way that allows them to learn code easily and quickly. Most people can do it in a about the same time with the same amount of effort. Some people cannot learn code by having things "beep" at them.

It's the same reason I've been thrown out of music schools :-(
I can't carry a tune except by rote memorization of the timing and it takes months for me to do it.

BTW typing has nothing to do with learing code, I can type with a modified version of touch typing that requires that I look often at the keys. I took touch typing in the late sixties and still can't do it right. My brain does not work that way.

I was told by a PhD.D. Speech Therapist that my problem was not that I don't have a sense of rhythm, I just can't connect to it. He prescribed exercises to help. This was after I passed my 5 wpm test, so I can't say if it worked or not.

I find Vassili's claim of learning code in one week as ridiculous as mine. :-)
He's at the fast end of the curve, I am way out at the slow end.

Code Quick works by making word associations with the letters. I cannot recognize dih dih dah dit at any speed, but I can recognize the phrase "did i FAIL it" at anything from 3 to 30 wpm. I cannot sustain that rate, yet, but I am working on it.

It is obvious why my ancestors left germany and became farmers in Lithauania, while other members of the family converted to christianity and became a hit

in the music business.

73,

Geoff.

>playing music is illegal.

The ARRL had an article years ago that stated since music on hold was not the
intent of the call, in fact it was incidental to the call, it would be
considered ok. However, if a station kept calling the number because with
the intent to listen to the music, then it is illegal.

For many years I was the chief control operator for my local groups repeaters
and have always asked that users interupt the music every few seconds with
their call letters while on hold.

73 Barry Rose K7yym

2919. faisyn20.zip - Electronic Filter Synthesis Program

Newsgroup: rec.radio.amateur.misc
Date: 1994-08-20 21:44:34 UTC
From: diviney@sky700.bwi.wec.com
Message-ID: <9408202144.kp14040@SimTel.Coast.NET>
Source record: 261371
Cross-posted to:
comp.archives.msdos.announce,rec.radio.info,sci.electronics,rec.radio.amateur.homebrew,rec.radio.amateur.misc

I have uploaded to the SimTel Software Repository (available by anonymous
ftp from the primary mirror site OAK.Oakland.Edu and its mirrors):

SimTel/msdos/electric/
faisyn20.zip Electronic filter synthesis program

FAISYN v2.0 is a low cost, effective alternative to expensive commercial
filter synthesis packages. The program has be used to design lumped
element filters and diplexers from 10's of KHz to 1.5GHz and is the
result of many years experience in filter design. Designers know that
filter design is often an iterative process. Tedious number grinding is
sometimes required to optimize a design. FAISYN eases the burden by
allowing the designer to quickly synthesize a variety of circuits that
can be simulated and compared using your favorite circuit simulator
(FAISYN currently supports PSPICE-TM Microsim, MMICAD-TM Optotek and
TOUCHSTONE-TM HP/EESOF circuit formats).

Special Requirements: None

Galen and anyone else interested....

NON FM use of 144 MHZ (know as "Weak Signal) is alive and well!

I publish a directory of Weak Signal VHFers throughout North America. This years edition had over 1800 Active VHFers in all of N. America, Which includes KL7, KH6, VE, W, XE, and the caribbean.

This past weekend was the annual Persieds Meteor Shower. If your not up on Meteors, When entering the atmosphere they ionize the air while burning up, forming a brief medium on which VHF signals will reflect.

Over a 5 day period I heard and worked many stations on 144 and 50 Mhz SSB/CW, Some as far as 1200 miles away.

The point is this... Just because you don't know about a thing does not mean it doesn't exist! Weak signal awareness needs to be stressed more whenever possible. Theres more than enough room for all who use the VHF bands. Just remember the bottom 300 to 500 Khz of every VHF band is for weak signal use only, not a place to hide from everyone else on the band. The use of FM in the "Weak Siganl" segment is against all band plans and more importantly discourtious to those of use who use SSB/CW on a regular basis. Please keep this in mind when looking for that quite place to operate FM simplex.

Another spot to avoid is the region of 145.8 - 146.0 Mhz. That is the Oscar downlink for mode B and should be avoided as FM in that area will make ALL satellites USELESS!

I've installed High level repeaters with remote bases, Operated long haul FM simplex, Worked 500+ mile SSB/CW simplex from 8000' Mtn tops, Worked Europe through Oscar 13, Worked Hawaii from NV on 144 Mhz using the Duct that appears in the summer, and worked worldwide 144 Mhz by bouncing signals off the Moon (EME).

All of that activity occurs in the bottom 300 Khz of 144 Mhz. To say hardly anyone participates in "NON FM" use of VHF is NOT CORRECT . Anyone wishing to know more about "Weak Signal" use of VHF, I refere you to N6CL's "VHF PLUS" and W3EP's "The World Above 50 Mhz" columns in CQ and QST. Another good resource are their books, "The VHF HOW TO book" by N6CL and "Beyond Line Of Sight" by W3EP, Both worth much more than their cover price for the info they contain.

2921. TNC Control Programs

Newsgroup: rec.radio.amateur.misc
Date: 1994-08-20 23:49:03 UTC
From: nunas@solomon.technet.sg
Message-ID: <3364pf$pvr@raffles.technet.sg>
Source record: 261374

Can anyone out there recommend a TNC control program for my needs?

I have a Compaq Contura 486 (mono) laptop, a PK232MBX (upgraded to latest ROM chips), a Kenwood TS450SAT barefoot to an R7 at 40 metrers AGL (about 125 feet for those of you in the US).

I work mostly RTTY on 20M, but dabble in the other modes and bands. I rarely use non-data modes (ssb, etc). I log to paper then transfer to Logic3.

I started with YAPP and did not like it because I had to remember all sorts of ROM level commands to make it do things.

I tried PCPAKRATT 5.5 (latest I think) but find that there are too many differences between what the same key does in different modes.

I think I would like a program that is very "visual". By that I mean something that has on-screen buttons to poke with the mouse to handle most of the often-used functions. But, other than YAPP and the AEA "kluge", I do not know much (anything) about other control programs.

Well, that's it. Any informed opinion ou there? Dumb question ;^>

Greg, A free kit would make you beholden?? Come one I would relish
your opinion on the kit. You're only too quick to pass judgement on
kits wich you have no actual hands-on experience, that's talent!
As much as you find it hard to believe, there are many more happy
novice builders of the FX than there are "experienced" builders. We
have tons of letters and responses from folks around the world who
are using the FX and enjoying the whole process of building, etc.
Seems as tho' the only "gripers" (yes that's my word) are seated
behind a CRT and have more experience with a Taiwanese keyboard than
a Weller (that's a name brand of a soldering iron, Greg). My offer
still holds, Greg, in fact I'll even pay you to assemble the kit and
ask for it back - you'll be fully reimbursed for your time and "effort"
You know, I was amazed that I receive not one phone call, I thought
I was quite rude and at least one person would want to discuss my
comments or shoot the breeze on the state of ham radio, why?
Greg, I'm sorry I've flamed on like this but it is guys like you
who spoil the fun for others, my e-mail doesn't lie. 73, John

Man, you guys are tough! I'm running out of free kits! Seriously, it is tough to write stuff for folks of all backgrounds. I think the reason we get less trouble from novice builders is that they actually read and follow the directions!
I'll start saving some kits that were sent back for repair by Extras and other "30 year" experience builders. I'll send those babies out as free kits!
Best regards! John

Hello Greg I would say that in order to really give you a fair answer
you would have to indicate if you plan to use the TNC on VHF only or
if you want to use it for VHF and HF and then the choices get kind of
subjective so maybe if you post your requirements I think I could you
give you my personal opinion completely unbiased :=) 73's....

From: Put_Your_Email_Address@here
Message-ID: <336l1b$2je@klatu.interserv.net>
Source record: 261288

The Iambic chips that are typically used in keyers, the Curtis 8044ABM, does have two modes available -- A&B. I can never remember which is which, but one has a self completing feature where as even if you come off of the paddle while a tone is sending, the subsequent dit or dah will still be sent. You must actually be ahead of the sound with your movement. Supposedly this can allow you to reach higher speeds with the paddle. The bigest impact I've seen, is that if you are used to the non-completing mode and try to use the self-completing you have a heck of a time not getting an extra dot or dash at the end of a character. Not a very detailed explaination I realize but I hope it helps. '73 Jeff WB3B

The question pool did change effective 7/1/94. A pretty significant upgrade, less than 1/2 of the origninal questions were included. If you are interested in the new pool in a Software Study Guide with lot's of features - graphics, explaninations, analysis etc. -- Call QSO Software at 1 800 GUD DX 73 -- 1 800 483 3973. Jeff

2937. Japanese Prefecture and City list available

Newsgroup: rec.radio.amateur.misc
Date: 1994-08-21 05:09:34 UTC
From: ena@ix.netcom.com
Message-ID: <336nie$qd@ixnews1.ix.netcom.com>
Source record: 261291

A list of the 47 Japanese prefectures and 653 cities along with their JCC numbers is available by anonymous FTP at ftp.netcom.com in /pub/eaubery/jcc.txt.

These numbers, often found on Japanese QSL cards, are used in applying for several JARL awards:

Worked All Japan prefecture Award (WAJA) - Obtain QSLs from stations in all 47 prefectures.

Japan Century Cities (JCC) - Obtain QSLs from stations in 100 different cities. Further awards are available for 200 - 600 cities.

Worked All Cities Awards (WACA) - Obtain QSLs from stations in all Japanese cities.

If you have similar lists for other awards, please let me know.

N6WFK - eric

MY last HAM class all recieved there license in four weeks. This was at the time everyone here was screaming about a 17 week delay. I never saw it. The FCC seems to be in gear now and working pretty smooth. Now is a good time to send a letter to the FCC recognizing good work. Or we could just be a bunch of whiners that only squawk when things aren't going just right. My letter is in the e- mail.

I use a Comet vertical, and was able to reach the east coast back in May.
Other folks use a beam. On 6, you just get lucky. I guess that is why
they call it the magic band.

I usually try and monitor 50.125 SSB every morning, and if the band opens
up, I try and be there. Hope to talk with you, and anyone else that is
lurking on the "magic band".

Just a quick note to remind you that the 1994 ARRL Southwestern Division convention is this coming weekend, Aug 26-28. It will be held at the Town and Country Hotel and Convention Center here in the Mission Valley area of San Diego. There will be lots to do with are sorts of technical sessions and forums. If you are within driving distance, and want to have a lot of fun in Americas Finest City, come on down. Registration is at $15 at the door. Hope to see you then.

73, Tuck KC6ZEC

DOVE-OSCAR-17 STATUS REPORT

HR AMSAT NEWS SERVICE BULLETIN 232.01 FROM AMSAT HQ
SILVER SPRING, MD AUGUST 20, 1994
TO ALL RADIO AMATEURS BT
BID: $ANS-232.01

DOVE-OSCAR-17 (DO-17) Status Report

After extensive development and testing on the ground, another in a series of planned software and hardware tests was activated in the DOVE (DO-17) satellite on 8/3/94 at about 04:40 UTC.

This software sends ASCII telemetry for 90 seconds, then a sequence of 8 tones from the on-board digital-to-analog converter (DAC) followed by three repetitions of the "Hi this is DOVE..." phrase from the voice synthesizer. There is also a new line of status information sent occasionally for test and debugging purposes called VSTAT. It contains data useful to developers and engineers. The purpose of this software is to test the DAC, the two way connection between the 68HC11 processor in the DOVE module and the V40 main processor in the computer module, and various software components and techniques.

The sequence of tones is created by sending digital values to the DAC that generate a pseudo sign wave. It is not intended to simulate a musical scale. However, the tone frequencies do span the nominal audio frequency range of the modulator/transmitter string so they can be used to measure frequency response of the spacecraft hardware.

While DOVE may not sound much different to listeners, hardware components never before activated are in use, along with new software techniques essential to the full exercise of DOVE's capabilities. It is worth noting that some of the hardware used in this test has been idle for 4 1/2 years in space, yet worked perfectly the first time.

With this critical test successfully completed, the development and operations team expects continue to expand DOVE's capabilities.

[The AMSAT News Service would like to thank WD0E and the DOVE Team for this bulletin item.]

PHASE-3D INTEGRATION IN ORLANDO

HR AMSAT NEWS SERVICE BULLETIN 232.02 FROM AMSAT HQ
SILVER SPRING, MD AUGUST 20, 1994
TO ALL RADIO AMATEURS BT
BID: $ANS-232.02

PHASE-3D Spacecraft Integration To Has Begun

Dick Jansson, AMSAT-NA's Vice President for Engineering, announces that progress preparing the Phase 3D spaceframe to receive its various modules is progressing well. He adds that one of the recent factors which greatly assisted this progress was the visit of Konrad Mueller DG7FDQ to the Orlando, Florida Integration Facility. Dick said that Konrad was a tireless worker during his short stay in Orlando, not getting any time to visit the beach or even Disney World. Those American "slave drivers" kept his attention glued to the Phase-3D task, Jansson commented. One of the last of the tasks completed, before departing for the airport for his trip home, was the bonding of final two equipment panels and heat pipes to the main structure.

AMSAT-NA President Bill Tynan (W3XO) comments that we greatly appreciate the corporation of AMSAT-DL in loaning Konrad Mueller to us so that this vital work could be accomplished in record time and with the high quality required in the construction of the Phase-3D satellite.

PHASE-3D PRESENTATIONS AT SURREY

HR AMSAT NEWS SERVICE BULLETIN 232.03 FROM AMSAT HQ
SILVER SPRING, MD AUGUST 20, 1994
TO ALL RADIO AMATEURS BT
BID: $ANS-232.03

Phase 3D Presentations at the Surrey Satellite Conference

Last week's ANS bulletins presented summaries of some of the papers presented at the International Amateur Satellite Conference held at the University of Surrey in England between July 29 and August 1. This week's bulletin includes more of the material presented on Phase-3D.

One interesting features presented on Phase-3D was in a paper by Dr. Karl Meinzer DJ4ZC and read by Peter Guelzow (DB2OS). It concerned the "LEILA". LEILA is a German acronym but basically it is an "anti-alligator device." LEILA is designed to seek out extra strong signals in the passband. It will initially transmit a Morse warning to the offender telling him or her to reduce power. If that goes unheeded, it will insert 18 dB of attenuation on the frequency of the offending signal. It was stated that LEILA will be able to handle up to five such notches simultaneously.

Peter also discussed the two RUDAKs computer planned for Phase 3D-RUDAK-E and RUDAK-U. The "E" stands for experimental and the "U" for users. RUDAK-U will use AX25 pacsat protocols with six uplinks and one or two down-links at 1200 and 9600 bps, and perhaps faster. The ramdisk should be 16 to 32 MBits. A mailbox is expected. RUDAK-E, similar to the computer on

AO-21, and is intended to support experiments with DSP front-ends for software modems at low and medium speeds such as 1200, 9600 and 19200 bps. Also on the cards is a regenerative modem faster than 64 Kbps and possibly one modem at about 500 Kbps. This will probably use 2400 MHz for one of the links and require 10 Watts of output from P3D and a 1 meter dish for the ground user.

In his talk, G6GEJ presented details on the 2M transmitter he has been building for Phase-3D. It is designed to operate from the 10.7 MHz I.F and uses conventional linear amplification. Mike impressed the group with the prototype of the unit, which he displayed at the meeting.

Hans van Groenendaal ZS5AKV described the 10 meter transmitter being designed and built in South Africa. It will use Compatible Amplitude Modulation (CAM) so that it can be received on simple short wave radios. Transmissions are to consist of 15 minutes of digitally generated audio. The system is intended mainly for educational purposes. It was noted that test transmissions from ZS6SRL using CAM can be heard on 10.125 MHz at 0800 UTC and 1700 UTC Mondays. The signal is beamed toward Europe.

WEEKLY OSCAR STATUS REPORTS

HR AMSAT NEWS SERVICE BULLETIN 232.04 FROM AMSAT HQ
SILVER SPRING, MD AUGUST 20, 1994
TO ALL RADIO AMATEURS BT
BID: $ANS-232.04

Weekly OSCAR Status Reports: 20-AUG-94

AO-13: Current Transponder Operating Schedule:
M QST *** AO-13 TRANSPONDER SCHEDULE *** 1994 Jul 11 - Sep 12
Mode-B : MA 0 to MA 90 | Omnis : MA 230 to MA 30
Mode-BS : MA 90 to MA 120 |
Mode-S : MA 120 to MA 122 |<- S beacon only
Mode-S : MA 122 to MA 145 |<- S transponder; B trsp. is OFF
Mode-S : MA 145 to MA 150 |<- S beacon only
Mode-BS : MA 150 to MA 180 | Blon/Blat 180/0
Mode-B : MA 180 to MA 256 | Move to attitude 230/0, Sep 12
==========
N QST *** AO-13 TRANSPONDER SCHEDULE *** 1994 Sep 12 - Dec 19
Mode-B : MA 30 to MA 150 |<- OFF Oct 22 - Nov 07 for eclipses
Mode-B : MA 150 to MA 190 | max duration 2h 12m
Mode-BS : MA 190 to MA 218 |
Mode-S : MA 218 to MA 220 |<- S beacon only
Mode-S : MA 220 to MA 230 |<- S transponder; B trsp. is OFF
Mode-B : MA 230 to MA 30 | Alon/Alat 230/0
Omnis : MA 250 to MA 140 | Move to attitude 180/0, Dec 19
The battery charge state is of paramount importance during the eclipse seasons. As always the command team may have to have to make temporary changes to the published schedule. In that case we will try to minimize

the inconvenience, setting Mode-B OFF from MA 230-256 in the first instance.

==========

[G3RUH/DB2OS/VK5AGR]

RS-10: NO1R has been enjoying RS-10's Mode A operation at his QTH near Boston. On several mid-Atlantic passes he has worked and confirmed G3ASM in grid square IO94 and F9HR in grid square JN18 near Paris. Robert (F9HR), appears to be very active and NO1R has heard him on both morning and evening passes. Last week, DH5ROB/TF, answered his CQ from Iceland. NO1R used to pass up these low angle mid-Atlantic passes, but now he has worked some of of his best DX on these passes. NO1R also adds that all these DX contacts were done using CW. [NO1R]

AO-16: AO-16 is up and running well. [WH6I]

KO-25: WH6I reports that KO-25 is up and running. He is having some trouble getting reliable data from it, however, and can't seem to find the problem. It's either in the bird, or he feels that he has got some new local interference on the downlink frequency. He is still checking. [WH6I]

KO-23: KO-23 On-Board-Computer (OBC) software crashed about one week ago. The engineers at the KAIST are currently downloading memory images for debugging purposes. Software reloading and packet service will not be carried out until the code dump process finished, which hopefully be completed by next Tuesday. [Hyungshin Kim (hskim@casaturn.kaist.ac.kr)]

The AMSAT NEWS Service (ANS) is looking for volunteers to contribute weekly OSCAR status reports. If you have a favorite OSCAR which you work on a regular basis and would like to contribute to this bulletin, please send your observations to WD0HHU at his CompuServe address of 70524,2272, on INTERNET at wd0hhu@amsat.org, or to his local packet BBS in the Denver, CO area, WD0HHU @ N0QCU. Also, if you find that the current set of orbital elements are not generating the correct AOS/LOS times at your QTH, PLEASE INCLUDE THAT INFORMATION AS WELL. The information you provide will be of value to all OSCAR enthusiasts.

/EX

> is it turns out that he is right an awful lot of the time.

Hey ya know? It's funny as I have noticed the same thing. I have also noticed that [insert Sara Lee song here] everybody doesn't like something. Ya always got those that do and those that don't, e.g. consider the ARRL too.

I think Luck Hurder, KY1T, said it best and in a nutshell:
[paraphrased] "Posting via this mode is rather LOUD." So, someone we would not normally hear in voice conversation would have our undivided attention as we read his/her post. [deja vu]

I've been reading Never Say die since about 1979. I find many of Wayne's ideas interesting and entertaining. I don't like everything he says or stands for. But you have to remember if it wasn't for Wayne Green, Christopher Columbus would have never discovered Vespucciland. 8-D

>noticed that [insert Sara Lee song here] everybody doesn't like something.

Wayne may be a bit of an agitator (GO WAYNE!!), but i think that a fair
assessment of any animosity would include these facts:

1. You don't agree with him, but he ends up being right
2. you don't agree with him but he seems to be making a living
3. You don't agree with him but how many people know who YOU are?
4. you don't agree with him, but...

i think the point has been made. There is room in this hobby, as in
Real Life ;-) for all opinions, even ones that you do not like. If your
ideas are so much better, step to the line...

p.s., agreeing with wayne regarding spectrum management or licensing
does not make you a homophobe!

Source record: 261301

```
EG>While there's plenty written about knife-edge diffraction, it's
EG>mostly concerned with VHF-and-up propagation. As frequency
EG>decreases, diffraction loss will decrease, which suggests that
EG>at HF it wouldn't be too lossy a process. This would assume that
EG>the diffracting obstacle is large in comparison with the wavelength,
EG>but in many cases that shouldn't be a problem.

The effect is seen regularly during the winter on 80 meters.
Along about 3:30PM EST (20:30 UTC) before sundown, Europeans
can be heard with good signals but its no use calling them.
They do not hear us. This is due to knife-edge diffraction.
It does happen at HF, even as low as 80M.
```

I have an Alinco DJ-560 HT.

One evening, while driving, I attempted to plug in the power supply. Unfortunately, I touched the PS lead to the external speaker jack located just above the PS jack. This appeared to have knocked out the audio circuit.

I was wondering:

1) Exactly what did I damage?

2) Any pointers to a reasonable, honest, & competent repair tech are greatly appreciated. I would prefer the person to be located in the Denver/Boulder area, but will not rule out repair by mail.

Please respond via e-mail.

Many TIA *

Back In The Olde Days, Tektronix the 'scope people had a tub of water and detergent at their repair sites. When a scope can in for repair, it first went into the tub for a wash, then hose down and dry.

Now, no other company built things the way Tektronix did Way Back Then (ceramic terminal strips, etc), and I doubt that anyone does it that way now.

Just a hysterical *** oops *** historical note.

SYNOPSIS OF ACTIVITY

Solar activity was at very low levels.

Solar activity forecast: solar activity is expected to be
at very low levels. Region 7767 is the most probable region to
produce a C class event.

The geomagnetic field has been at mostly quiet levels
for the past 24 hours.

Geophysical activity forecast: the geomagnetic field is
expected to be at mostly quiet levels.

Event probabilities 21 aug-23 aug

Class M 10/05/01
Class X 01/01/01
Proton 01/01/01
PCAF Green

Geomagnetic activity probabilities 21 aug-23 aug

A. Middle Latitudes
Active 15/15/15
Minor Storm 10/10/10
Major-Severe Storm 01/01/01

B. High Latitudes
Active 20/20/20
Minor Storm 10/10/10
Major-Severe Storm 05/05/05

HF propagation conditions were normal over all regions.
No changes are expected over the next 72 hours. The threat for
flare-related short wave fadeouts is only slight as Region 7765
spends the next 24 hours rotating behind the west solar limb.
Near-normal propagation will continue over the next 72 hours,
through 23 August inclusive.

EVENTS WITH SWEEPS AND/OR OPTICAL PHENOMENA FOR THE LAST UTC DAY

Date Begin Max End Xray Op Region Locn Sweeps/Optical Observations
------ ---- ---- ---- ---- -- ------ ------ --------------------------
NO EVENTS OBSERVED.

NOTES:
All times are in Universal Time (UT). Characters preceding begin, max,
and end times are defined as: B = Before, U = Uncertain, A = After.
All times associated with x-ray flares (ex. flares which produce
associated x-ray bursts) refer to the begin, max, and end times of the
x-rays. Flares which are not associated with x-ray signatures use the
optical observations to determine the begin, max, and end times.

Acronyms used to identify sweeps and optical phenomena include:

II = Type II Sweep Frequency Event
III = Type III Sweep
IV = Type IV Sweep
V = Type V Sweep
Continuum = Continuum Radio Event

Loop = Loop Prominence System,
Spray = Limb Spray,
Surge = Bright Limb Surge,
EPL = Eruptive Prominence on the Limb.

: Can anyone recommend shops in Hongkong?
: Is anyone living in Hongkong reading this?

: Tnx,
: Detlef.

There's gobs of places to buy ham equipment in Hong Kong.
Some of the shops are along Nathan Road.

My observations:
1. I was surprised how many older models are still in stock
over there (IC-02AT, TH-26AT, etc.).
2. Be very careful which version of radio you buy.
There are different versions for various parts of the
world to match local band plans, etc.
3. I didn't think the prices were all *that* great anyway.

Source record: 261308

Selling Tek 485 O'scope. Dual channel. The 300 Mhz range does not work but all other ranges work up to 150Mhz. Tektronix tells me it's a switch contact. Asking $350 or will swap for Pro-43 scanner or AOR1000 (Any handheld scanner w/UHF Air). I prefer interested parties to be in the Maryland area so those interested can come by to check out the scope in person if they wish. E-mail me if interested.

In article <777510136snz@arkas.demon.co.uk> Michael@arkas.demon.co.uk writes:
>Ham Radio magazine. Haven't picked up a copy for years. Is it still published?

Sadly, no. CQ bought it and closed it. All they wanted was to assume the subscriber list to temporarily boost their circulation figures and enhance ad revenue. I suspect few _Ham Radio_ subscribers renewed CQ after their subscriptions ran out.

CQ did throw us a sop though. They publish _Communications Quarterly_. As the name suggests, it comes out 4 times a year, and it's of moderately good technical quality. About the best US amateur publication still in print as a matter of fact. Of course the $9.95 cover price is somewhat off putting.

If your interest in radio is even moderately technical, your best bet is to subscribe to the RSGB magazine, or if you read Japanese, to the Japanese _Ham Radio_ magazine. Both are much superior to any of the remaining US publications.

That leads me to a question for our non-US readers. What is the best amateur radio magazine in the world? Capsule reviews of non-US magazines would be most welcome.

Gary

Message-ID: <carreiroCuwzF6.MIp@netcom.com>
Source record: 261311

Macy Hallock (macy@telemax.com) wrote:
: Don't know if this is useful to you in your case. You might also want
: to ask about such coverage as an adjunct to your homeowners insurance.
: It's not the much different than fine art or jewelry coverage. The
: issues are the cost per $100, the deductible, and claims procedures.

On that note, I'd like to caution everyone who thinks that their homeowner's insurance policy "personal property" coverage will cover mobile gear.
I had assumed that my Allstate coverage, which covered personal property outside the home (up to 10% of the personal property value, ie: $50,000 personal property coverage yields $5,000 coverage for property outside the home), would cover my mobile radio gear.

Unfortunately I had a chance to test out that policy early this year.
4 rigs, antennas and a scanner taken. I went though the entire process of making a claim, providing receipts, serial numbers and pictures.
Thoughout the process I was given the impression that there would be no problem. Then, right when I thought I would receive my settlement, they came up with a clause in the policy that said something to the effect that they do not cover any equipment that gets its power from the car battery and reproduces audio. They directed me to my auto insurance which to no suprise said if it was not previously declared on the policy, they would not cover it.

My point: I would have attained other insurance if I had known that my personal property coverage did not cover "gear that gets its power from the car's battery, and reproduces audio".

Don't fall into that gap!

Hopeing your mobiles are safe, secure and insured (as mine now are!)....
73 for now. Paul N6HCS

>send a letter to the FCC recognizing good work. Or we could just be a bunch of
>whiners that only squawk when things aren't going just right. My letter is in
>the e- mail.

You never saw it because your class lucked out.

Details were posted here several weeks ago, to paraphrase: Once the FCC's
new license processing system went on line, they brought in temps. At
first the temps were not informed of the FIFO policy. They just went at
it! That situation was quickly rectified, but in the meantime, a whole
bunch of folks got their tickets in <7 weeks.

There are still hundreds (thousands?) that have been waiting mu-u-uch
longer. One of my friends passed Tech at the Tulsa hamfest on 21 May and
has yet to receive his license. That's 91 days today.

ARRL VEC, are you listening?

From: sethr@netcom.com
Message-ID: <sethrCux0F9.1B2@netcom.com>
Source record: 261314

Ok this might be a really dumb question - but I am going to ask it anyway.

If one needed to download truly large files from the Internet (say in the range of 100 files of 50 megs each every day) - then the first thing that jumps to mind is - direct connect and bring in a T1 trunk from the *phone company* and lease it for about $900 per month - right?

Is this actually the most economical way to do it? Couldn't an enterprising network provider who is already hooked up to the net just interface with a radio transmitter that could put data on the air waves and allow anyone with a receiver/modem to pick it up for the cost of the equipment and the cost to the network provider? Hey I told you it was a dumb question before you started reading!

Cross-posted to: rec.radio.scanner,rec.radio.amateur.policy,rec.radio.amateur.misc

Does anyone know of the laws in Canada or Mexico about stores being able to sell radio scanners that are modifiable to scan the cellular spectrum? I'm curious here. Is it as tough as the U.S. law, which I now think makes it illegal to sell this product as of April, 1994, once all existing stock is depleted.
Would anyone think U.S. Customs would confiscate such a device, if one was to try to bring one back that they purchased? Does customs go about confiscating radios? In my experience in traveling to Canada, I've never had a problem coming back to the U.S. I've been through Vancouver & Toronto airports, and each time U.S. Customs seems to just wave me by, sometimes not even wanting to see my ID or airplane ticket.

Any answers?

2966. learning CW

Newsgroup: rec.radio.amateur.misc
Date: 1994-08-22 03:52:19 UTC
From: oo7@astro.as.utexas.edu
Message-ID: <3397dj$rsb@geraldo.cc.utexas.edu>
Source record: 261318

We see a lot of requests here for computer programs by people interested in learning "the code". Some of us real oldies who were born before there were such things as computers learned our CW by listening on the air to real people sending real code, and perhaps some people still learn it that way these days.

I'm curious to know whether those who learn it from computer programs that send perfect code in a quiet room find it a shock once they get on the air and have to contend with real people sending code, fading signals, QRM, all that stuff? Is it easy to make the transition to the real world?

Perhaps it helps to learn the code without the distractions, but it must be a shock to some people - does this turn people off using it even after they have passed a code test?

I realize that computer programs can tell you the speed at which you are copying, and can be programmed to send other than the standard ham QSO material that you hear on the air all the time and which is not always the most exciting text to copy, and I suppose a compromise is the W1AW code practise sessions (which I used so as to figure out my code copying speed).

Anyone have any real data on this? Do people who teach the code ever use real radios in class, and do teachers even have students send code?

Posted-By: auto-faq 3.1.1.4
Archive-name: radio/ham-radio/faq/part1
Revision: 1.2 08/21/94 20:38:02

Rec.radio.amateur.misc Frequently Asked Questions
Part 1 - Introduction to the FAQ and Amateur Radio
------------------------------------------------------------------------------

This is a regular posting of frequently-asked questions (FAQ) about Amateur
Radio, also known as Ham Radio. It is intended to summarize some common
questions on the rec.radio.amateur.misc newsgroup and Info-Hams mail list
as well as to help beginners get started.

Please provide a copy of the FAQ to any new or soon-to-be Hams you know.

Regular FAQ postings can help save network bandwidth and maintain a good
signal-to-noise ratio in the newsgroup. However, they can't do it alone - you,
the reader, have to use them.
* If you are a new user, please print and review the FAQ articles and look at
the instructions in the news.announce.newusers newsgroup before posting any
articles. If you don't find the answer in the FAQ and you have tried
elsewhere, then you have "done your homework" and it is acceptable to ask
the question on the UseNet newsgroups. Along with your question, please
state where else you have looked for the answer so others also know that
you have done your homework.
* If you are an experienced user, please help by refraining from answering
frequently-asked questions on the newsgroup if they are already answered by
the FAQ articles. Instead, send e-mail to the user who asked the question.
(It will be helpful if you include the part of the FAQ that answers their
question, but not the whole thing.)

The FAQ cannot always prevent people from posting repetitive questions. But
even if hundreds of questions get posted, it saves you from having to answer
them hundreds of times. Also, a friendly pointer to the FAQ in your first
answer can help that person refer to the FAQ in the future. That is when we
can begin to get a real savings of network bandwidth.

To reduce the size of each article, the FAQ information is posted in 3 parts:
Part 1 - Introduction to the FAQ and Amateur Radio
Part 2 - Amateur Radio Organizations, Services, and Information Sources
Part 3 - Amateur Radio Advanced and Technical Questions

** What do all those "tones" mean? (pre-4/92)
** Where can I learn more about Amateur Radio if I live outside the US? (9/93)
** How can I get a "reciprocal license" if I am a licensed ham from another country or if I am a FCC licensed ham who wants to operate in another country (on vacation)? (9/93)
** My apartment or housing complex does not allow outdoor antennas, now what do I do? (9/93)
** I got TVI...HELP!!! (9/93)
** Did you know that you can get college credit for being a ham? (pre-4/92)
** On what frequencies do JPL and GSFC retransmit the shuttle audio? (10/92)
** Can I take my HT on an airplane and operate it if I get the permission of the captain? (4/92)
** How do I modify my current Amateur license? (9/93)
** I'm confused about XXX, should I ask the FCC? (9/93)
** Is there any information on antique radios? (pre-4/92)
** Where can I buy vacuum tubes? (9/93)
** What do I need to get started in packet radio? (9/93)
** What do I need to get started in satellite communications? (9/93)
** What is available to get started in ATV, SSTV and WEFAX? (9/93)
** What are these contests I sometimes hear, and how do I participate? (9/93)

--Rec.radio.amateur.misc Frequently-asked Questions------------------Part 1--

** Introduction to the FAQ

* How to Contribute to the FAQ Articles

We accept suggestions from the Amateur Radio community. Please consider that all new contributions need to be SHORT and concise in order to be included. If a contribution is too long, the FAQ editors can help you find a more appropriate FTP archive or mail server for your article.

We always accept corrections. Please allow some time (often not the next issue of the FAQ) because the FAQ maintainers do this as volunteers so each must give higher priority to their employers.

Send correspondence to hamradio-faq@amdahl.com so that it will reach all the FAQ coordinators: (listed in alphabetical order)

Ed Hare KA1CV ehare@arrl.org (Newington, CT, USA)
Jack GF Hill W4PPT root@jackatak.raider.net(Brentwood, TN, USA)
Ian Kluft KD6EUI ikluft@oes.amdahl.com (Santa Clara, CA, USA)
Paul Schleck KD3FU pschleck@gonix.com (Omaha, NE, USA)

Chris Swartout N6WCP cas30@uts.amdahl.com (San Jose, CA, USA)
Steve Watt KD6GGD steve@wattres.sj.ca.us (San Jose, CA, USA)
Rosalie White WA1STO rwhite@arrl.org (Newington, CT, USA)
Derek Wills AA5BT oo7@astro.as.utexas.edu (Austin, TX, USA)

* Do Not Ask Questions of the Editors

We wish it wasn't necessary to say this. Please don't send questions to the editors (unless you are sending an answer with it as a submission for the FAQ.) The proper procedure for questions on UseNet is 1) Read the FAQ, 2) if it isn't there, check other sources, and 3) post on the newsgroup.

The Internet has become an atmoshpere where questions are asked of everyone as if they have an infinite amount of time to help. The volunteers who maintain the FAQ do not have time to answer questions. Some FAQ maintainers on the Net have been led to believe that no good deed goes unpunished - let's avoid bringing the same end to this effort.

* Acknowledgements

All questions listed as modified "pre-4/92" are entirely Diana Carlson KC1SP's work or her editing of a contributor's work. Diana established this FAQ and credit is due to her for founding this project.

Thanks to Devon Bowen KA2NRC for accepting this FAQ in e-mail every month to keep the FTP archive at ftp.cs.buffalo.edu up-to-date.

* Notes on "Netiquette"

The rec.radio.amateur.misc newsgroup and Info-Hams mail list have a large daily volume of traffic. They can operate more efficiently if the following netiquette guidelines are followed. Please take them seriously.
* If you are new to UseNet, the introductory articles in news.announce.newusers are required reading. Go to that newsgroup now. Definitely, read the instructions there before posting anything. Other rec.radio.amateur.* readers will appreciate it!
* Pick the right newsgroup. Use only the most specific newsgroup for your subject. For example, a question about a homebrew antenna only needs to be posted to rec.radio.amateur.antenna. Also, don't post to rec.radio.amateur.misc when the subject can go in another rec.radio.amateur.* newsgroup. So, when there is a more specific newsgroup, that's the one you want.
* When posting a followup article, ALWAYS try to minimize the number of lines of quoted material from the original article.
* As a general rule when you try to determine whether to reply to someone by e-mail or with a followup article, remember to "praise in public, criticize in private." It's OK to disagree technically but be careful not to attack the person with whom you disagree. Also, be careful with your use of the word "you" when posting a follow-up

article. Many unnecessary flame wars have started that way.
* Use a descriptive subject. For example, a message subject of "Ham Radio" tells the reader NOTHING about the contents of your article since the whole newsgroup is about Ham Radio. Other examples of subjects which are so broad that they become useless could include, "Help," "A Question," "Antennas," or "Frequencies." Maybe "Books on Antennas?" or "Where can I find Repeater Frequencies?" would be better, for example. Remember, in a busy newsgroup a lot of users decide which articles to read from the subject line alone. If you post, don't deprive yourself of an audience!
* Before answering a question, check if the FAQ adequately answers it or if someone else already answered it. If you have more to add, make sure to reference either the FAQ or the related articles.
* If a user posts a question which is directly answered by the FAQ, there is no need to post an answer - the information is already available on the newsgroup. Instead, just send an e-mail message which politely explains where to find the FAQ. They will probably appreciate it if you include the answer to their question. (Don't send a "nastygram" - that would just discourage future participation.)
* Pay attention to the size of your audience - use the "Distribution:" header. If you leave it blank, your message will go to every civilized country in the world and occupy disk space in all news systems in all those places. If that's what you intend, that's fine but make sure your article is relevant outside your country. (In particular, Hams should already know there is more to the world than just their own country.)
* If you have an item for sale, please limit the distribution area so that, for example, an article about a radio for sale in New Jersey won't get to California or Europe. If you wish, you may cross-post your for-sale article to rec.radio.swap.
* Software sources should be posted to either alt.sources, comp.sources.misc, or comp.sources.* for a specific machine type. Software binaries should be posted to the appropriate subgroup of comp.binaries.

** What is Amateur Radio?
Amateur Radio is a non-commercial radio communication service whose primary aims are public service, technical training and experimentation, and communication between private persons. Amateur Radio operators are commonly called hams. Hams often communicate with each other recreationally but also provide communications for others at public events or in times of emergency or disaster.

** Who can become a ham?
The answer to this question differs in every country.

The answer for the USA is listed below. If your country has a newsgroup specifically for it (i.e. UK, Australia, Germany) the most accurate answers can be found there. See Part 2 for the list of region-specific newsgroups.

If that doesn't help, the American Radio Relay League (ARRL) may be able to help because they communicate with similar organizations in other countries, probably including yours. They can be reached by electronic mail or surface mail (see Part 2.)

In the USA, anyone who is not a representative of a foreign government can be an Amateur Radio operator. There are tests that you must pass to get a license, however the tests are not insurmountable. On that general level, the requirements are probably similar in almost every country.

For more information on becoming a Ham in the USA, the ARRL has a toll-free number where you can request information: 1-800-32-NEW-HAM (don't worry about the number being one digit too long - the phone system ignores it.) Other information can also be obtained from the ARRL e-mail information server in the file called PROSPECT. Details on the server are in Part 2.

** Where can I locate information and books on Amateur Radio?
Your local Radio Shack sells some ham radios and Amateur Radio license books. Books can also be obtained through the mail from ham radio organizations, such as ARRL in Newington, CT (203-666-1541) and W5YI in Dallas, TX (1-800-669-9594). There may be one or two ham radio stores in the local area (ie, within 50 miles). Try looking in the Yellow Pages under Radio Communications.

For the Novice license, get a Novice License manual, plus 5-word-per-minute Morse code tapes, costing around $25. For the Technician license, get a combined Novice and Technician License manual, and an FCC Rules manual, costing around $32. The FCC Rules manual is a good idea for Novice also, but not necessary, since the Novice License manual contains all the FCC Rules that are required for the Novice License.

The ARRL Education Activities Department has several programs to help amateurs (or prospective amateurs) to get started. Ask for a "New prospect package" available free of charge, from ARRL HQ, Educational Activities Department, 225 Main St, Newington, CT 06111.

Information on Ham Radio can also be obtained with your computer. Part 2 of this FAQ contains a significant amount of material on that subject.

** How much does it cost?
To take the tests for any class of amateur radio license, there is a small charge (around $5-$6 currently) to cover copying costs and running the testing sessions. (Due to changes in 1993, Novice tests are under same procedures as the others.) The cost of a radio is really dependent on what you want to do. You can make your own radio and antenna for under $150. You can buy a used single-band radio for $150-$300. Or you can buy a new multi-band multi-mode radio with all the doodads for $300-$3000. I'd suggest you learn more about ham

radio, talk to local hams, find out what you want to do with ham radio first.

** Where can I take the tests?
The Novice tests Used to be given by any two qualified hams of General class license or above. Now all the license tests are given by three qualified Volunteer Examiners (VEs) who volunteer their time.

To locate an ARRL testing session in your area, you can contact ARRL at 203-666-1541 x282.

See also the section "Where can I find VE sessions in my local area?" in Part 2 because more information is available via UseNet.

** What are the tests like?
First off, come prepared to VE sessions. Bring: TWO forms of ID, one of which has a picture on it; a calculator (if necessary); a pen and two pencils; the applicable examination fee (around $5-$6 for 1993); the original AND a copy of your current Amateur Radio license (if you have one); the original AND a copy of any CSCEs for tests you've already passed (if you have any).

Each of the written tests (Novice, Technician, General, Advanced, and Extra) are generally a multiple choice test of approximately one-tenth of the question pool. For example, if the question pool is approximately 300 questions, then the test will be a 30-question test. You need to get 75% correct to pass. Note that they truncate to determine the correct number of questions. That means for a 30 question test, you need to get 22 right, which is actually only 73.3%.

Once you've paid the small fee for Technician-Extra tests, it costs no extra to take another test, so I'd suggest you keep taking the next more advanced test until you fail. If you pass the written but not the Morse code (or vice versa) for a specific class license, you have up to one year to take the other test before you would have to retake the written test again. Note that some VEs will not allow you to take the written test unless you've first taken the Morse code test.

The Morse code test is a receiving test only. The test run 5 to 7 minutes. After the test, you are given a 10-question multiple-choice or fill-in-the-blank test. Passing grade is 7 or more. If you fail the 10-question test, the examiner team will examine your copy sheet to see if you have 1 minute of solid copy with no errors. For 5 wpm, that's 25 characters, for 13 wpm, that's 65 characters, for 20 wpm, that's 100 characters. If they can find 1 minute solid copy, you've still passed.

Hints on Morse code tests: Generally, it will be a standard QSO (conversation), and it MUST contain at least one of each of the following:
26 letters A-Z, 10 numbers 0-9, comma (,), period (.), slant or slash (/), question mark (?), double dash prosign (BT), end of

message prosign (AR), end of contact prosign (SK).
The letters count as one character, all others count as two characters. There are a couple other prosigns which are worth knowing, but will not be on the test, like "I'm done talking, next" is K, "I'm done talking, back to you" is KN, "Please wait" is AS.

** What can I do with a ham radio license?
There are so many things, it's a difficult question to answer, but here's some ideas:
* Talk to people in foreign countries.
* Talk to people (both local and far away) on your drive to work.
* Help in emergencies by providing communications.
* Provide communications in parades or walkathons.
* Help other people become hams.
* Hook your computer to your radio and communicate by computers.
* Collect QSL cards (cards from other hams) from all over the United States and foreign countries and receive awards.
* Participate in contests or Field Day events.
* Provide radio services to your local Civil Defense organization thru ARES (Amateur Radio Emergency Service) or RACES (Radio Amateur Civil Emergency Service).
* Aid members of the US military by joining MARS (Military Affiliate Radio System).
* Participate in transmitter hunt games and maybe build your own direction-finding equipment.
* Have someone to talk to on those sleepless nights at home.
* Receive weather pictures via satellites.
* Build radios, antennas, learn some electronics and radio theory.
* Talk to astronauts in space, or use the moon to bounce signals back to people on the Earth.
* Experiment with Amateur TV (ATV), Slow-Scan TV (SSTV), or send still-frame pictures by facsimile.
* Experiment with amateur satellite communications.

** What can't I do with an Amateur Radio license?
The most important thing you can't do is transact business of any kind over ham radio. Interference to other hams or services, as well as obscene, profane or indecent language is not tolerated and is illegal. Music and broadcasting are not allowed on ham radio. Some personal conversations may not be appropriate to Amateur Radio. Do you really want the whole world to hear about Aunt Mabel's hemorrhoids?

** I'm interested, who will help me?
There are hams who are willing to become "Elmers" (mentors, helpers) in your local area. Look around and ask local hams. Search out local radio clubs. As well, some people have volunteered to be an Elmer over the Usenet. A list of UseNet Elmers and their e-mail addresses is posted to the newsgroup monthly. If anyone wants to be an Elmer, send e-mail to
elmers-request@unomaha.edu

There is also a lot to be said for exploring on your own. Take a look around the FTP archives and e-mail servers listed in Part 2. There's so much out there on UseNet, you'll find plenty of things you're interested in.

** Should I build my own equipment or antenna?
[see also rec.radio.amateur.homebrew and rec.radio.amateur.antenna]
"Homebrewing" is a fun and educational part of ham radio. It is a thrill to build your own transmitter and put it on the air. However, building your own receiver can be quite complicated; if you don't have electronics experience, you may want to buy a receiver instead. Most homebrew transmitters are QRP (transmit very low power). That's fine for an experienced ham with a very good antenna, but a Novice ham will just get frustrated. Your first rig, therefore should NOT be a home-brew.

Antennas can be much simpler projects than the transceiver, though some types are also quite involved. Most hams build their own antennas for base station use and buy antennas for mobile (car) use. Most beginner ham books describe how to build different types of antennas. Order of difficulty, from easiest to more difficult, for some common antennas are: wire dipole, Zepp, Yagi, Quad, and Log-Periodic. Books from many sources, including ARRL and several Hams, discuss antennas in depth.

When building or even understanding antennas, it is good to know the relationship between the antenna element length and the frequency or wavelength it is designed for. An antenna performs best at multiples of 1/4 of that wavelength, though 5/8 wave also has beneficial qualities. The wavelength is related to the frequency with the following formula:

wavelength (in meters) = 300 / frequency (in megahertz)

You do not need a huge antenna or tower like ones you may see around your neighborhood. Large beam antennas and 40-foot towers are very expensive. As a beginner, a simple dipole antenna is perfectly adequate. As you gain experience (and money :-), you may want to invest in something bigger.

If you can afford new rigs and antennas, there are many mail order stores that advertise in ham radio magazines. If you want to buy a used rig, the best place is at a "hamfest" (ham flea market). You should take along an experienced ham, since some of the used equipment may be inoperative, overpriced or poor quality. You can also answer ads in ham magazines or posted at ham radio stores, although often, by the time you call, the equipment has already been sold.

2968. rec.radio.amateur.misc Frequently Asked Questions (Part 2 of 3)

Newsgroup: rec.radio.amateur.misc
Date: 1994-08-22 05:43:06 UTC

Rec.radio.amateur.misc Frequently Asked Questions
Part 2 - Amateur Radio Organizations, Services, and Information Sources
------------------------------------------------------------------------------

Questions discussed in Part 2: (dates indicate last modification)
** Where can I find Ham Radio information with a computer? (8/94)
* Mosaic, World-Wide Web, Gopher, and WAIS (8/94)
* The rec.radio.* newsgroups (2/94)
* The ARRL e-mail server (1/93)
* The KA6ETB e-mail "HAM-server" (2/94)
* The Internet File Transfer Protocol (FTP) (2/94)
* Access to FTP archives via electronic mail (1/93)
* The Ham-Radio mail list: rec.radio.amateur.misc by mail (9/93)
* Telephone BBS's with Ham-related information (9/93)
* Callsign servers and geographical name servers (1/94)
* FTP access to FCC Part 97 and FCC Amateur Radio question pools (1/94)
* Lists of radio modifications and extensions (2/94)
** Can I send ARRL or W5YI electronic mail? (11/92)
** "Why doesn't the ARRL do...?" (11/92)
** What magazines are available for Ham Radio? (pre-4/92)
** How do I use the incoming and outgoing QSL bureau? (11/92)
** Are there any news groups for CAP? (11/92)
** What's the name of the QRP club that issues QRP numbers? (9/93)
** How do I become a 10-10 member? (9/93)
** How do I join MARS? (9/93)
** How do I join RACES? (pre-4/92)
** What organizations are available to help handicapped hams? (pre-4/92)
** I am looking for a specific ham, can anyone help me find him? (6/93)
** Can I post my neat new ham related program on rec.radio.amateur.misc?
(pre-4/92)
** Where can I get ham radio software for my computer? (9/93)
** Are there Dialup News services or BBSs for Amateur Radio? (4/92)
** Where can I find VE sessions in my local area? (9/93)
** Why isn't XXX available electronically? (1/94)
** I'd like to volunteer to help ham radio through electronic
information services like those mentioned in this FAQ list.
Where should I start? (2/94)

--Rec.radio.amateur.misc Frequently-asked Questions------------------Part 2--
```

** Where can I find Ham Radio information with a computer?
This question has many answers spanning several electronic media including WWW, UseNet, electronic mail, the Internet, dialup BBS's and others. Various electronic information sources are summarized under the subheadings that follow.

All electronic mail addresses listed are in Internet format. If your site is not connected to the Internet and does not support Internet-style mail addresses, you will need to contact either your system administrators or a local "guru" to find out how or if you can send mail to the sites listed. Ask them, "how can I get mail to the Internet?" and show them the address you're interested in.

* Mosaic, World-Wide Web, Gopher, and WAIS
A new generation of information retrieval tools exploded into great popularity on the Internet in 1993 and 1994. They are the gopher protocol, wide-area information server (WAIS) and World-Wide Web (WWW). They are indeed complete topics of discussion unto themselves which can be found, among other places, in the following newsgroups:

comp.archives
comp.infosystems.announce
comp.infosystems.gopher
comp.infosystems.wais
comp.infosystems.www

Please read those newsgroups if you have questions about the software or how to use it.

At the current rate of growth, we can never hope to list all the servers. We would like cooperation from people who assemble WWW servers to add references to other useful Ham Radio information available at other WWW, gopher, WAIS, and FTP sites. That way the FAQ can direct readers to servers that can reference more servers with more information than we can include on a periodic UseNet posting.

Some useful URLs (uniform resource locators) which can be used with WWW (Mosaic, Lynx, etc.) are as follows:

General Ham Radio Information:

Ham Radio FAQs & info: (The OSU server turns this into WWW hypertext)
http://www.cis.ohio-state.edu/hypertext/faq/usenet/radio/ham-radio/top.html
file://rtfm.mit.edu/pub/usenet/radio/ham-radio
all radio FAQs & info:
http://www.cis.ohio-state.edu/hypertext/faq/usenet/radio/top.html
wais://rtfm.mit.edu/usenet/radio
Federal Communications Commission:
http://www.fcc.gov/
http://www.fcc.gov/1/Private_Radio
North Carolina State HamRadio WWW Server:
http://www.acs.ncsu.edu/HamRadio
Yahoo's Ham Radio Index:
http://akebono.stanford.edu/yahoo/Entertainment/Hobbies_and_Crafts/Amateur_Radio/

EINet Galaxy's Ham Radio Page:

http://www.ntt.jp/gnn/wic/hobbies.02.html (Japan)
http://www.elvis.msk.su/gnn/wic/hobbies.02.html (Russia)
http://src.doc.ic.ac.uk/gnn/wic/hobbies.02.html (UK)
University of Buffalo's FTP server:
file://ftp.cs.buffalo.edu/pub/ham-radio
Oakland University's FTP server:
file://oak.oakland.edu/pub/hamradio

Specialized Topics:

SAREX: Shuttle Amateur Radio Experiment
http://hypatia.gsfc.nasa.gov/sarex_mainpage.html
Morse Code Demo
http://macgwy-mac2.gsfc.nasa.gov/GARC/exp/morse.html

Although still very much works-in-progress, the last two URL's
are excellent examples of WWW servers with numerous references
to other resources.

* The rec.radio.* newsgroups
The primary distribution mechanism for this FAQ is UseNet. There
are several newsgroups dealing with Amateur Radio and other aspects
of radio. The full list is as follows:

rec.radio.amateur.misc (*) Ham Radio - misc/general topics
rec.radio.amateur.antenna Ham Radio - antenna construction/theory
rec.radio.amateur.equipment Ham Radio - manufactured equipment/mods
rec.radio.amateur.digital.misc Ham Radio - digital radio modes: packet/
AMTOR/RTTY/etc (formerly r.r.a.packet)
rec.radio.amateur.homebrew Ham Radio - radio experimentation, kits
rec.radio.amateur.policy Ham Radio - policy & regulation
rec.radio.amateur.space Ham Radio - satellites, EME, shuttle/MIR
rec.radio.broadcasting public broadcast radio
rec.radio.cb Citizens' Band Radio
rec.radio.info (*) periodic info from all rec.radio groups
rec.radio.noncomm misc non-commercial radio topics
rec.radio.shortwave Shortwave Radio
rec.radio.scanner Utility Radio above 30Mhz
rec.radio.swap radio equipment wanted and for sale

Country- or region-specific newsgroups include the following:
aus.radio Australia (misc radio topics)
aus.radio.amsat Australia (amateur satellites)

aus.radio.packet Australia (packet radio)
de.comm.ham Deutschland/Germany
fj.comm.ham Japan
uk.radio.amateur United Kingdom
in.ham-radio USA, Indiana
sbay.hams USA, CA, South Bay Area/Silicon Valley
triangle.radio USA, NC, Research Triangle area

This FAQ is cross-posted to the newsgroups marked with asterisks (*).
It is also cross-posted to rec.answers (the archive for FAQs in the
rec.* newsgroups) and to news.answers (UseNet's general repository for
FAQs.) These should be the first places to look for new current
copies of the FAQ.

Most of the rec.radio newsgroups have their own FAQs as well.

* The ARRL e-mail server
ARRL is the American Radio Relay League, representing and promoting
Amateur Radio in the USA. They have established an automated file
server which responds to information requests via electronic mail.
To use the server, send mail to info@arrl.org with any number of
one-line commands in your message. Valid commands are as follows:

help sends more detailed instructions about the e-mail server
index sends a list of the files currently available
send file sends a file (replace "file" with the file's name)
several files are referenced by name in parts of this FAQ
quit ends command processing - use it if a signature will be
appended to your message

The server program will respond to the commands, each in a separate
message. Among many other informative files, a current copy of the
FAQ (updated monthly) can be obtained from the ARRL e-mail server.
Other parts of this FAQ refer to specific files on the ARRL server.

* The KA6ETB e-mail "HAM-server"
Steve Harding KA6ETB has an e-mail server on his 386 PC at home with
over 40 megabytes of Ham Radio-related files (at the time of this
writing.) You can request any of those files with an e-mail message
to the HAM-server at ham-server@grafex.sbay.org. This site
has a mostly-different selection of files than the ARRL, though some
overlap is unavoidable. The HAM-server seems to have more emphasis
on MS-DOS programs and binary files though there are many plain-text
articles as well.

Use these commands to send requests to the KA6ETB HAM-server.
HELP instructions and info about the HAM-server
INDEX list of files available from the system
GET <file> send a file (see the HELP notes for more info on
getting binary files in uuencode or xxencode format)
NEWFILES <date> list of new files since the given date
PING used for testing your path to the HAM-server, it just

sends a simple reply so you can look at the path data
QUIT makes the HAM-server stop reading the message (so it
won't try to read your .signature)

* The Internet File Transfer Protocol (FTP)
Sites connected to the Internet can access large amounts of data
almost anywhere in the world, often at high speeds. One common way
to transfer the data you want is FTP. Some sites offer a service
called "anonymous FTP" which allows remote users to access a set of
public files without requiring a password.

Perry Rovers coordinates a fairly definitive list (formerly
maintained by Tom Czarnik) of anonymous FTP sites, their IP
IP numbers, time zones, general contents, and access policies
which he posts to several newsgroups, including comp.archives,
comp.sources.wanted and news.answers. It is itself available
via anonymous FTP (how about that?? :-) from (among other places)
rtfm.mit.edu under directory /pub/usenet/news.answers/ftp-list.

For specific information about exact locations of files by name,
the Archie database server may be of help. First check if anyone has
installed the "archie" program on your machine and use it. Archie may
also be accessed by telnetting to one of many sites. The list
of archie sites is numerous and growing fast. For a current
list of sites, telnet to archie.sura.net (login "archie"), then
please use the one closest to you to conserve network bandwidth.

For those without telnet capability, the database may be accessed non-
interactively via mail server. Send E-mail with the word "help" to
archie@host where host is one of the Archie sites above.

The above two resources (the FTP list and the Archie server) are
extremely powerful tools for finding out "what's out there" at various
FTP sites around the world. *PLEASE* exhaust their capabilities
before posting requests to the net.

The following is a brief summary of major ham-related FTP sites and
places where you can obtain a current copy of this FAQ:

ftp.cs.buffalo.edu:/pub/ham-radio
(submissions to this ftp site should be made to
bowen@cs.buffalo.edu) - Contains many ham radio files,
including the FAQs, Elmer list, SWL and scanner info, Packet
FAQ, examination opportunities, information on various
regulations, information on commercial radios (i.e. GE or
Motorola), SSTV (slow-scan TV), HTs (handheld transceivers).
Recently, the rec.radio.amateur Working Group (rra-wg,
see below for more information about their mailing list)
has started to encourage archivers of radio modification
instructions to mirror them at this site. In this way,
maintainers may come and go but the collection of
mods will remain continuously available (and undergo

constant positive growth). This FAQ is updated monthly
here.
grivel.une.edu.au:/pub/ham-radio
Australian mirror of ftp.cs.buffalo.edu
nic.funet.fi:/pub/ham
This is one of the largest FTP sites in Europe and maybe the
most popular. /pub/ham/info contains a mirror of Buffalo.
Other topics available here include amiga, antenna, HF, packet,
satellite, scanners, program sources, VHF and others.
This site is also one of the article archives for the
rec.radio.info newsgroup.
ftp.uu.net:/networking/ka9q
A large FTP site in the USA - UUNET contains sources and
binaries for many different types of computers.
ftp.ucsd.edu:/ (site was down when we were looking for the new path)
The "home" site (with the most recent versions for the largest
number of different computer platforms) of the KA9Q TCP/IP
Network Operating System (NOS), other ham-related software,
and the archives for the Info-Hams, Packet-Radio, Ham-Policy,
Radio-Info and TCP-Group digests.
vixen.cso.uiuc.edu:/pub/ham-radio
This site contains the HyperCard Hamstacks written by Diana
Carlson as well as ASCII readable ham radio question pools.
ftp.apple.com:/pub/ham-radio
Ham software and information, especially Macintosh software
rtfm.mit.edu:/pub/usenet/news.answers/radio/ham-radio
all participating FAQs and periodic informational postings are
archived here, including those from the rec.radio.* newsgroups
which can be found in pub/usenet/news.answers/radio.
Participating FAQs are automatically archived here when they
are posted on UseNet.
ftp.amdahl.com:/pub/radio/amateur
cd pub/radio/amateur - the most up-to-date copy of the FAQ
(updated nightly when changes are made)
world.std.com
The Ham Radio archive at this site has been moved to
oak.oakland.edu.
oak.oakland.edu:/pub/hamradio
oak.oakland.edu:/pub/hamradio/arrl
Mac, Amiga, Atari, PC files in their own subdirectories.
Also radio mods and an Internet mirror of the ARRL info
server.

See also the file FTP-INFO on the ARRL e-mail server.

If you experience difficulty connecting to the above FTP sites, some
troubleshooting hints are shown below. The unfortunate situation here
is that Netnews is far more prevalent than direct Internet hookups,
accurate name servers, smart mailers and routers, and of course,
telnet and FTP client services. What this means is that your trouble
may be caused by MANY factors.

Here's some hints to check what's wrong:
* It may very well be that your newsfeed and email are via dialup line
and UUCP (Unix-to-Unix copy) in the wee hours of the morning. If
this is the case, then you have no direct connection to the Internet
and thus cannot use real-time interactive services like FTP and
telnet.
* If you are at a college or university, your host (ie, the computer
you are logged onto) may be on the Bitnet network, which has an
email gateway to the Internet, but no direct connect capability.
* If you do have a direct connection to the Internet, does your host
have telnet and/or FTP client programs? (ie, if you type "ftp" or
"telnet" at your command prompt, do you get anything?) Many hosts,
particularly IBM mainframes not running Unix, do not support these
services!
* Can you telnet to other hosts and get a login prompt?
It may very well be that some hosts are "not recognized" due to
misconfigured connections and inaccurate host tables/name servers
(*.mil computers are *NOTORIOUS* for this!)
* If you get "host not in host table" or "host unknown" or similar
error, try telnetting via the IP number, a set of four 1-3-digit
numbers separated by periods (eg, 198.137.220.1). The exact IP
number for the site can be obtained via the nslookup utility, if
your computer supports it. (The FAQ does not print IP addresses any
more because they change so often.) Your system may not recognize
the "fully-qualified domain name" (like callsign.cs.buffalo.edu),
but it should ALWAYS recognize an IP number if their network is
reachable from yours.
* If you get "network unreachable" check with some more knowledgeable
users if your site is actually connected to the Internet. If it is,
a link in the network may be temporarily disconnected for maintenance
(or by accident.)
* In the case of telnetting to a non-default port (as in the case
with the callbook servers), if telnet <host> <port#> doesn't work,
but you can telnet to the default login port (ie, no qualifiers),
then the manner at which the port qualifier is entered may be
system dependent. Also, at many education sites, it is common
practice to block telnet connections above TCP socket 1000 or
so in a somewhat misguided attempt to block usage of
"recreational" TCP socket applications such as Multiple User
Dungeons (MUD's) or Internet Relay Chat (IRC). In most cases,
a polite word to the system administrators, pointing out
the worthwhile services available on sockets 2000 and 3000
will get telnet service unblocked, at least for those ports.
* Syntax for telnetting from different operating systems differ.
Some common command syntaxes are: (angle brackets are for
readability, do not type these in literally)
Berkeley Unix or VMS with Wollongong TCP/IP uses syntax:
telnet <host> <socket#>
Other possibilities to try:
telnet console <host> (for 2000 port)
telnet <CR> open <host>:<port#>

telnet <host>/<port#>
telnet <host>/port=<port#> (for Multinet on VMS)
* Compression techniques are different for different operating systems.
However, these hints should help:
foo.sit needs Macintosh UnStuffit to unstuff
foo.hqx needs Macintosh BinHex to uncompress
foo.tar needs Unix or GNU tar utility to extract archived files
foo.Z needs Unix 'uncompress' to uncompress or VMS
compress_vms.exe (on gatekeeper.dec.com) will work too.
foo.z needs the GNU gzip utility (from prep.ai.mit.edu) to
uncompress it. gzip will also uncompress *.Z files.
If more than one method was used,
like for foo.hqx.Z, start at the outside and work in (so uncompress
on Unix with 'uncompress' first, transfer to MacIntosh, then
uncompress with BinHex to get uncompressed file).
* There is an excellent introduction to FTP and archiving software
regularly posted to comp.binaries.ibm.pc and news.answers.
* If all else fails, ASK your system administrator or check system
documentation.

* Access to FTP archives via electronic mail
ANY BITNET, EARN, or NorthNET site can access the Princeton mail
server. It will be most efficient if you know the complete path
and filename for anything you wish to transfer, but you can use
'cd' and 'ls -l' commands to move about and browse the remote site's
directories. The Archie database server may also be useful to search
for files and their directory locations on FTP sites around the world
(see below). Please be patient when using non-interactive mail
servers such as BITFTP as each request may take several hours (or
longer) to be fulfilled.

For access to the FTP server, send email to bitftp@pucc.bitnet (for
BITNET, EARN and NorthNET users ONLY!). Subject doesn't matter.
The text of the email is the FTP commands one after another. For
example, suppose you wanted to access the FTP site lcs.mit.edu:
FTP lcs.mit.edu
USER anonymous
PASS yourname@yoursite (not required)
ASCII
CD telecom-archives
GET filenames
BYE
A help file is available giving detailed instructions by putting
the single word HELP into the text of the email.

For nonBITNET users, there is also a FTPMAIL server at
ftpmail@decwrl.dec.com. Commands include: REPLY <mailaddr>,
CONNECT [HOST [user [pass]]], ASCII, BINARY, COMPRESS, COMPACT,
UUENCODE, BTOA, LS <directory>, DIR <directory>, GET <file>, QUIT,
HELP. Get the help file for more information by sending mail with
the single line "help". The ftpmail site may complain if you try

try to get more than 1 file per email request. Here is an example of
a request:
reply your_name@your_site
connect vixen.cso.uiuc.edu
binary
uuencode
get pub/ham-radio/extra-pool.txt
quit

A note on the use of FTP mailservers: If you want to use FTP
mailservers, like FTPMAIL, please be considerate of any systems that
your mail must pass through. The quickest way to find yourself cut
off from the world is to make the admins of sites that pass your mail
pass 60Mb of X11 graphics system source. If you need large amounts
of information from a mailserver, contact your admin for help -- it
may already be available, or he may know a better way to get it.

* The UCSD Ham-Radio mail list: rec.radio.amateur.misc by mail
You can use rec.radio.amateur.misc even if your site has no NetNews
feed. To subscribe to rec.radio.amateur.misc, send email to:
Ham-Radio-Request@ucsd.edu
In the body of the message, write:
subscribe Ham-Radio
If your local e-mail software does not provide a valid return address
(i.e. Bitnet, many Milnet sites, and many non-Unix e-mail packages)
you can provide your return address between the "subscribe" and the
name of the mailing list (i.e. "subscribe myname@here.org Ham-Radio".)

Similarly, to subscribe to some other rec.radio.* newsgroups, use
the following directions: (all addresses here are @ucsd.edu)
Request address List address Newsgroup
Ham-Radio-Request Ham-Radio rec.radio.amateur.misc
Ham-Digital-Request Ham-Digital rec.radio.amateur.digital.misc
Ham-Policy-Request Ham-Policy rec.radio.amateur.policy
Ham-Equip-Request Ham-Equip rec.radio.amateur.equipment
Ham-Ant-Request Ham-Ant rec.radio.amateur.antenna
Ham-Homebrew-Policy Ham-Homebrew rec.radio.amateur.homebrew
Ham-Space-Request Ham-Space rec.radio.amateur.space
Radio-Info-Request Radio-Info rec.radio.info

IMPORTANT NETIQUETTE NOTE: never ever send a request to subscribe
or unsubscribe from *any* mail list to the list itself. Always use
the REQUEST address. Otherwise you'll end up broadcasting your
request to everyone on the list and getting lots of people angry at
you. (Seriously - this is a completely avoidable mistake and it
does irritate a lot of people.)

TO UNSUBSCRIBE, follow directions above, changing the command word
"subscribe" to "unsubscribe"
DON'T POST TO THE NEWSGROUP ITSELF! USE THE REQUEST ADDRESS!
Help is available by using the command word "help". Note that command
words MUST be the first word on each line of the message.

You can post to rec.radio.amateur.* by sending your posting email to the mail list addresses at ucsd.edu. Since rec.radio.info is a moderated newsgroup, requests to post to it may be sent to Radio-Info but they will be mailed to the moderator, rec-radio-info@ve6mgs.ampr.ab.ca, for posting.

All of the Amateur radio newsgroups are archived for FTP on ucsd.edu under subdirectory mailarchives/{mail-list-name}. However, Radio-Info is not archived at UCSD because almost everything is either on one of the other lists or in the news.answers archives at rtfm.mit.edu (see also funic.funet.fi above).

To subscribe to rec.radio.shortwave, send email to listserv@cuvma.columbia.edu, message is "subscribe swl-l (your name)"

* Telephone BBS's with Ham-related information
Among many, a large one is WB3FFV. Use 8/N/1. The phone numbers are
(410)-661-2475 1200-38400/MNP5/V32bis/V42bis
(410)-661-2598 1200-38400/MNP5/V32bis/V42bis/PEP
(410)-661-2648 1200-19200/MNP5/V42bis/PEP
Login is bbs, no password. This BBS is also available via UUCP, login is uucpanon, no password. For a list of available files, try:
uucp wb3ffv!~/FILES /usr/spool/uucppublic

Another one is N8EMR at phone 614-895-2553, login hbbs. Data settings are 8 bits, NO parity, 1 stop bit. N8EMR has a comprehensive list of other ham-related BBS's on-line.

ARRL has a BBS called "HIRAM", named after the League's founder. The number is 203-666-0578. More information can be obtained from the file ARRL-BBS on the ARRL e-mail server.

For a more complete list of Ham Radio BBS's, see the file BBS on the ARRL server. See also the file BBS_LIST.TXT on the KA6ETB HAM-server. Also see many of the FTP sites listed earlier in this section. There is now way to keep a list like this anywhere near up-to-date so giving you a lot of sources is the next-best thing!

* Callsign servers and geographical name servers
We know of online callsign servers for the USA, Canada and UK.

If you are at an Internet site you can connect using telnet to the following callbook server (covering the USA and Canada):
callsign.cs.buffalo.edu

There is also a general geographical name server at
martini.eecs.umich.edu

For the UK, you can use a WWW client to access the following URL:
http://www.mcc.ac.uk/htbin/callbook

The callbook server sits on port number 2000 and the geographical name server sits on port 3000. These are different port numbers than what telnet usually defaults to. So if you just telnet to these machines, you will get a login prompt instead of the server. How you

tell your telnet program to connect to port 2000 or 3000 instead of the default port is operating system dependent but it is usually done with a line like

telnet callsign.cs.Buffalo.edu 2000

If this doesn't work, check the telnet/FTP troubleshooting hints above or consult your local systems guru for the proper command string.

The interactive servers are designed to be somewhat self-explanatory and they support fairly detailed help facilities. The first command you should execute when connecting to one of these servers is "info". This will list general info about that server and how to use it. You should then type "help" to list the various commands available. Typing "help" followed by a command name will give you a little more detail about that command. Servers allow searches by call, last name, zip code or city and also provide regular expression filters to trim your searches so you get a reasonable amount of output.

Both these servers are built from a database distributed by Rusty Carruth, N7IKQ. This database currently contains US and Canadian callsigns and it does not contain club calls. A new version of the database is sent around approximately once a year.

There is also an email callsign server at callbook@sat.datapoint.com (The UUCP address is ...!uunet!dptspd!callbook). In the body of the text, say "lookup" followed by callsigns you want to look up. If your mailer appends signature files, you should put a line "quit" at the end of your request (before the signature file). If you want help, put the word "help" on a line by itself. Here is what a request might look like:

```
help
lookup kc1sp wn4bbj
lookup n0fzd
quit
```

There is another email callsign server at callbook@n8emr.cmhnet.org. The subject line is the list of callsigns to lookup. All other lines are ignored. This same callsign server can be accessed with packet radio via cbook@n8jyv.#cmh.oh.usa.na. The body of the message should include "REPLY n8jyv!HOME_BBS!CALL" (where HOME_BBS is YOUR home BBS, and CALL is YOUR callsign), carriage return, "CALL call1 call2 ..." (where call1 call2 .... is space separated list of callsigns you want to lookup).

If you are a packet radio station, callserver data is available from REQQTH@WA4ONG.VA.USA.NA, subject line should be up to 5 US callsigns, separated by spaces. For Canadian calls, use the callserver at REQQTH@VE3JF.ON.CAN. Body of message is ignored. The server is an OS interface to the MBL packet BBS using the Buckmaster CD-ROM callsign database.

The FCC "call sign hotline" at 717-337-1212 is available for those who wish to listen to the call signs allocated in each group for each district. This requires only a touch-tone telephone to use.

* FTP access to FCC Part 97 and FCC Amateur Radio question pools
Part 97 is part of the FCC regulations and only applies to the USA. As of 1/94, a current copy can be found at ftp.cs.buffalo.edu in the /pub/ham-radio directory.

An ASCII copy of the question pools are available by ftp from the ARRL e-mail server.

* Lists of radio modifications and extensions
[see also rec.radio.amateur.equipment]
The largest collection of mods data that we know about is kept at ftp.cs.buffalo.edu in the /pub/ham-radio/mods directory. The maintainer of this archive strongly encourages all existing archivers of mods to mirror their collections on this site. in this way, maintainers will come and go, but the collection of mods will remain stable and accessible.

There is a packet radio Mods Server. To get the directories, send a packet as follows:
SP REQFIL@N2IMC.NJ.USA.NA
Subject: MODS\Dir.1
/EX
To get the mod, send to same place, with Subject MODS\Filename.ext.

REMEMBER that any modification is likely to void your warranty and that these mods are NOT guaranteed to work. This list is supplied here because it is a frequently-asked question on the newsgroup.

** Can I send ARRL or W5YI electronic mail?
Several ARRL HQ staffers can be contacted via the net. Their e-mail addresses are available from the ARRL e-mail file server in the file called "EMAIL".

ARRL requests that you include your postal address (the slow kind) in case they need to send you nonelectronic material in answer to your request.

W5YI, a large VEC, can be reached at the following address:
Fred Maia, W5YI 3511297@mcimail.com

** "Why doesn't the ARRL do...?"
If you want the ARRL to do something, tell them! Direct input from a concerned member (or, actually, any concerned Ham) carries a lot more weight than hearsay from any source. Their e-mail addresses are available from the ARRL e-mail file server (see above). They want direct input - that's why those addresses are available.

** What magazines are available for Ham Radio?
Your local ham store may have some, but here's some popular ones (this is NOT a complete list!):

QST, ARRL, 225 Main St, Newington, CT 06111 - basic projects and contesting
CQ The Radio Amateur's Journal, 76 North Broadway, Hicksville, NY 11801 - beginner ham radio articles
73 Amateur Radio Today, WGE Center, Forect Rd, Hancock, NH 03449, FAX (603) 525-4423, email: COMPUSERVE 70310,775 or Internet 70310.775@compuserve.com - more technical ham radio articles
QEX, ARRL, 225 Main St, Newington, CT 06111 - more technical projects
WorldRadio, 2120 28th St, Sacramento, CA 95818, (916) 457-3655. Subscriptions to 201 Lathrop Way, Ste D, Sacramento, CA 95815, (800) 365-SUBS - lots of special interest columns, like QRP, ATV, YL, etc.
W5YI Report, PO Box 565101, Dallas, TX 75356, 1-800-669-9594 - up-to-date information on Amateur Radio happenings, including VE information and statistics

** How do I use the incoming and outgoing QSL bureau?
To use the outgoing QSL bureau, you must be a member of ARRL. In general, you send a bundle of foreign (not States!) QSL cards to the outgoing bureau in Newington, Connecticut, along with a label off of your QST magazine (which shows ARRL membership), along with $2 per pound of cards (approximately 150 cards) or $1 for 10 cards or less.

To use the incoming QSL bureau, you do NOT have to be a member of ARRL. Send one or more Self-Addressed Stamped Envelopes (size 5x7 or 6x9, NO BIGGER, NO SMALLER) with one ounce of postage attached and with your callsign in 3/4" letters in top left hand corner where the return address label would go. If you expect a large quantity of foreign QSL cards, attach extra money or postage with a paper clip; do NOT affix extra postage to envelope. Send the envelopes to the QSL bureau for your callsign area. If your callsign is xx3xxx/5, you would send it to the 3rd call area, NOT the 5th call area. Addresses for QSL bureaus are listed in QST and on the ARRL e-mail server (see below); if you don't have access to a QST magazine, ask another ham. IMPORTANT: BE PATIENT! Turnaround time for a US QSL bureau, not considering foreign QSL bureaus, is about 3 months. Foreign QSL bureaus and hams can be as fast as 2 months or as slow as TEN YEARS, while average is about 6-12 months.

Addresses for the US incoming and outgoing QSL Bureaus are available from the ARRL e-mail server in the files called "QSL-IN" and "QSL-OUT". See the question above

** Are there any news groups for CAP?
There is no news group just for Civil Air Patrol discussions. However, rec.aviation.misc is appropriate for CAP aviation discussions and for CAP radio information, these rec.radio.amateur.* groups are available. CAP-related files are also stored on the FTP site sunburn.cps.udayton.edu in pub/capital.

** What's the name of the QRP club that issues QRP numbers?
QRP Amateur Radio Club International, c/o Bill Harding K4AHK,
10923 Carters Oak Way, Burke, VA 22015.

See also the file QRP-ADDRESSES on the ARRL e-mail server.

** How do I become a 10-10 member?
10-10 is simply an organization to sponsor the use of the 10 meter band. It was first conceived when propagation was poor on 10 meters, as a method to get more hams to use 10 meters. The past few years have been great for 10 meters worldwide. However, "the bands are closing down" again, and 10 meters will once again be limited more for local communications, except for sporadic band openings, until the next sunspot cycle.

To join 10-10, work ten 10-10 members and LOG each 10-10 number, call sign, operator's name and location. Send the list to your numeric call sign or DX area manager (as shown below), with $5.00 U.S. new membership registration fee ($6.00 for foreign addresses).

10-10 International Area Managers:
USA 1 - Al Kaiser N1API, 194 Glen Hills Rd, Meriden, CT 06450
USA 2 - Larry Berger WA2SUH, 9 Nancy Blvd, Merrick, NY 11566
USA 3 - Chester Gardner N3GZE, 9028 Overhill Dr, Ellicott Cty,MD 21042
USA 4 - KY, TN, FL, VA, NC, SC only
Rick Roberts N4KCC, 7106 Ridgestone Dr,Ooltewah, TN 37363
USA 4 - GA, AL, Puerto Rico only
Jim Beswick W4YHF, 112 Owl Town Farm, Ellijay, GA 30540
USA 5 - Grace Dunlap K5MRU,* Box 445, LaFeria, TX 78559
*summer addr Jun-Oct Box 13, Rand, CO 80473
USA 6 - Dick Rauschler W6ANK, 4371 Cambria St, Fremont, CA 94538
USA 7 - Willie Madison WB7VZI, 10512 W Butler Dr, Peoria, AZ 85345
USA 8 - John Hugentober N8FU, 4441 Andreas Ave, Cincinatti, OH 45211
USA 9 - Jim Williams N9HHU, 240 Park Rd, Creve Coeur, IL 61611
USA 0 - Debbie Peterson KF0NV, RR 1 Box 35, Duncombe, IA 50532
All DX- Carol Hugentober K8DHK,4441 Andreas Ave, Cincinatti, OH 45211

For more info, see the file 10-10-INFO on the ARRL e-mail server.

** How do I join MARS?
To join MARS, you have to be 14 years or older (parental consent required under age 17), be a US citizen or resident alien, possess a valid Amateur Radio license, possess a station capable of operating on MARS HF frequencies, and be able to operate the minimum amount of time for each quarter (12 hours for Army and Air Force; 18 hours for Navy-Marines). Novices must upgrade to Technician within 6 months, else be dropped from MARS. No-Code Techs can apply, provided they have transmit and receive HF capability for MARS frequencies (they don't need transmit capability for Amateur HF frequencies). For application forms contact:

Chief, Air Force MARS
HQ AFC4A/SYXR

203 W. Losey St. Room 1020
Scott AFB, IL 62225-5219
(618)256-5552 Fax: (618) 256-5126

Chief, US Army MARS
HQ USA Information Systems Command
ATTN: ASOP-HF
Ft. Huachuca, AZ 85613-5000
800-633-1128

Chief, Navy-Marine Corps MARS
Naval Communication Unit
Washington, DC 20397-5161

** How do I join RACES?
Contact your nearest Civil Defense or Emergency Management Agency. The Radio Amateur Civil Emergency Service is a part of a municipal, county, or state government. This does not mean, however, that every such government has a RACES program. If your government does not have a RACES, ask them to refer you to the nearest jurisdiction that does have a RACES program.

** What organizations are available to help handicapped hams?
Courage Center
Handihams
2915 Golden Valley Rd
Golden Valley, MN 55422
(612) 520-0515
ARRL has a Handihams information package (get it by requesting it through 2155052@mcimail.com) and a book called "The ARRL Plan for the Disabled", available at no charge from the ARRL Regulatory Information Branch.

** I am looking for a specific ham, can anyone help me find him?
Rather than sending out a message on Usenet, you might first try the "Radio Amateurs on Usenet" listings, maintained and posted by Mark Salyzyn VE6MGS. The articles can be found monthly on rec.radio.info and rec.radio.amateur.misc. If the copy in your news spool has expired for some reason, you can look up an entry in the list by sending an e-mail to reqnet@ve6mgs.ampr.ab.ca with either of the following commands in the body of the message:
lookup keyword keyword keyword ...
return user@machine.subdomain.domain
(Fill in the proper info for the search keyword or e-mail address.)
An automated server program will reply to your message.

If you have his/her callsign or name, you should also try one of the on-line callservers shown above. This works in most cases. (!!!)

Also try directory assistance from the phone company or the locator service provided by the Salvation Army. A Salvation Army post in your local area may be able to help you. Also, the Quarter-Century

Wireless Assn maintains a collection of callbooks going back to "the beginning of time". Their address is: 1409 Cooper Drive, Irving, TX 75061. Also, the Callbook has a dial-in line for accessing new ham callsigns. Try (1-708-234-8011) at 2400 baud.

** Can I post my neat new ham related program on rec.radio.amateur.misc?
This is really not a good idea, since many of the readers receive these newsgroups as mail digests. Posting is also a one-shot thing. If you post and someone missed it, it is gone. A better way would be to announce the existence of your program here, along with information on how to obtain a copy of your program. You can also submit it to one of the FTP archive sites, which will allow the world to access it without you having to mail it to each requestor. If you just GOTTA post it somewhere, post it to more appropriate groups, like comp.sources.unix or alt.sources or comp.binaries.ibm.pc.

** Where can I get ham radio software for my computer?
See the information about Anonymous FTP, e-mail servers, and ham-related telephone BBS's above. For PC-clones, see the KA6ETB HAM-server. For Macintosh computers, see the file SOFTWARE-MAC on the ARRL e-mail server for locations to look.

** Are there Dialup News services or BBSs for Amateur Radio?
There are two major news services for ham radio. Both are run by volunteer hams and provide bulletins of specific interest to amateurs, hence they are perfectly legal to rebroadcast on ham bands according to FCC Regulation 97.111B(6). To lessen the load on the dialup lines, consider getting your local repeater operator to rebroadcast it, or tape record it to play at your favorite HF net.

RAIN (Radio Amateur Information Network) is produced by Hap Holly, KC9RP, located in Illinois. The news is typically updated 8am CST Fridays. Phone numbers are 1-708-299-INFO (299-4636) and 1-708-827-RAIN (827-7246).

NEWSLINE is another, produced by Bill Pasternak, WA6ITF. Donations for NEWSLINE are accepted at Newsline Support Fund, c/o Dr. Norm Chalfin K6PGX, Pasadena, CA 91102. Phone numbers are:
Chicago 1-708-289-0423
N.Florida 1-407-259-4479
West Palm Beach 1-407-965-1234
Los Angeles 1-805-296-2407 (Instant Update Line)
Los Angeles 1-213-462-0008
NYC 1-718-353-2801
Ohio 1-513-275-9991
Seattle 1-206-368-3969

** Where can I find VE sessions in my local area?
VE sessions are often announced in the local newspapers, but more often, they are announced by local radio bulletin boards. The local packet BBS will most likely have a monthly updated schedule for VE sessions. ARRL or W5YI can generally be called and asked for

local VE sessions as well. Don't forget that you will need the following when you go in for an upgrade: a copy of your current Amateur license; your original Amateur license; any CSCEs (duplicate not required), if applicable and less than a year old; a picture ID, preferably a driver's license, passport or visa; and the VE test fee (approximately $5 right now).

Bart Jahnke, KB9NM, the ARRL VEC Manager (bjahnke@arrl.org) posts a listing of VE exams indexed by state (and some overseas sites, usually at embassies and military bases) to the net every 6 weeks or so. The same list can be obtained from the ARRL e-mail server under the file EXAM-SCHEDULE. Another file of interest is EXAM-INFO.

The ARRL list is the definitive list for ARRL VEC sessions. There are other smaller VECs around the USA. ARRL includes their schedules when the info is available. The other VECs phone numbers are listed with the ARRL info so you may wish to give them a call to check their schedule if they didn't provide it to ARRL.

** Why isn't XXX available electronically?
This is a theme for a lot of common questions. For the "XXX" above, substitute any of the following:
Callbooks
DX QSL Lists
Radio station lists
various publications
and more...

Except for the Callbook (via callsign servers), these are not available because of any of several reasons. Either there are copyright restric-tions, royalty fees, or the source just may not have done the work. Also, not everyone that has information has reliable UseNet access.

** I'd like to volunteer to help ham radio through electronic information services like those mentioned in this FAQ list. Where should I start?
This FAQ would not be complete without a reminder that useful resources on the net do not grow on trees, they are the work of many dedicated volunteers. The rec.radio.amateur.* newsgroups are very fortunate to have quite a number of such volunteers providing everything from FAQ lists to telnettable callsign servers. This doesn't mean, however, that there isn't room for more information and services from additional volunteers. One such service would be more detailed FAQ lists for the recently--created special-interest rec.radio.amateur.* newsgroups (such as those for antennas, homebrew electronics, equipment and ham radio in space) to supplement this general FAQ.

Recently an electronic mailing list for amateur radio FAQ maintainers, archive custodians, service providers, and other volunteers was set up. It is the rec.radio.amateur.* Working Group (rra-wg). Anyone with a sincere interest is welcome to

subscribe by sending E-mail to rra-wg-request@amdahl.com. The readers of that forum would be more than happy to provide advice and guidance with regard to an existing information project, or even suggest a new one to fill a currently-unmet need.

2969. rec.radio.amateur.misc Frequently Asked Questions (Part 3 of 3)

Rec.radio.amateur.misc Frequently Asked Questions
Part 3 - Amateur Radio Advanced and Technical Questions
------------------------------------------------------------------------------

Questions discussed in Part 3: (dates indicate last modification)
** What are the different US amateur classes and what can each of them do?
(pre-4/92)
** What is the best way to learn Morse Code? (10/92)
** What is the standard for measuring Morse code speed? (pre-4/92)
** What is the standard phonetic alphabet? (new 9/93)
** I'm confused. What do all those abbreviations mean??? (6/93)
** What do all those "tones" mean? (pre-4/92)
** Where can I learn more about Amateur Radio if I live outside the US?
(9/93)
** How can I get a "reciprocal license" if I am a licensed ham from another
country or if I am a FCC licensed ham who wants to operate in another
country (on vacation)? (9/93)
** My apartment or housing complex does not allow outdoor antennas, now what
do I do? (9/93)
** I got TVI...HELP!!! (9/93)
** Did you know that you can get college credit for being a ham? (pre-4/92)
** On what frequencies do JPL and GSFC retransmit the shuttle audio?
(10/92)
** Can I take my HT on an airplane and operate it if I get the permission
of the captain? (4/92)
** How do I modify my current Amateur license? (9/93)
** I'm confused about XXX, should I ask the FCC? (9/93)
** Is there any information on antique radios? (pre-4/92)
** Where can I buy vacuum tubes? (9/93)
** What do I need to get started in packet radio? (9/93)
** What do I need to get started in satellite communications? (9/93)
** What is available to get started in ATV, SSTV and WEFAX? (9/93)
** What are these contests I sometimes hear, and how do I participate? (9/93)

--Rec.radio.amateur.misc Frequently-asked Questions------------------Part 3--

** What are the different US amateur classes and what can each of them do?
Novice - has CW (Morse code) privileges on 4 HF bands (80, 40, 15,
and 10 meter), Voice privileges on 10 meters, and privileges
on 2 VHF/UHF bands (220 MHz and 1290 MHz).
```

Required are 5 wpm Morse code test and 30-question Novice test.
Technician - has full privileges on all VHF/UHF bands above 30 MHz.
Required are Novice test and 25-question Tech test.
Technician may access Novice HF bands by passing the 5 wpm Morse code test.
General - has all Technician privileges, plus larger access to more HF bands, including CW and Voice on 160, 80, 40, 30, 20, 17, 15, 12, and 10 meter bands. A General class amateur can give Novice tests.
Required are 13 wpm Morse code test, Novice, Tech and 25-question General test.
Advanced - has all General privileges, plus wider band access on 80, 40, 20, and 15 meter bands. An Advanced class amateur can also become a VE and give tests to Novice and Tech tests.
Required are 13 wpm Morse code test, Novice, Tech, General and 50-question Advanced test. The Advanced test is the most difficult of the five written tests.
Amateur Extra - has full privileges on all amateur bands. An Extra can become a VE and give all amateur tests.
Required are 20 wpm Morse code test, Novice, Tech, General, Advanced and 40-question Extra test.

** What is the best way to learn Morse Code?
This is becoming an increasingly common question as many "no-code" Technicians realize they can add more privileges to their license if they learn Morse Code. The following list of suggestions should be helpful in finding ways to approach the effort.

* Listen to code at a rate faster than you can copy.
* Participate in Novice-Roundup and/or Field Day. Practice whenever you get the chance!
* Avoid the "deciphering" plateau around 5 WPM and and character plateau at 10 WPM by listening to the fast Farnsworth-paced "beat" of each letter and the "beat" of common words. (See the question on Morse code speed for more information on Farnsworth pacing.)
* Practice to develop a "copy buffer" so you copy about 5 characters behind. (This is not easy but it's how the higher speeds are done.)
* Practice both with headphones and "open-air" copy as the code test may be in either format. (If you only practice one, you may fumble on the other.)
* Most of all, don't give up! Recognize when you reach plateaus and keep trying until you break through them.

** What is the standard for measuring Morse code speed?
The word PARIS was chosen as the standard length for CW code speed. Each dit counts for one count, each dash counts for three counts, intra-character spacing is one count, inter-character spacing is three counts and inter-word spacing is seven counts, so the word PARIS is exactly 50 counts:

```
PPPPPPPPPPPPP AAAAA RRRRRRRRR IIIII SSSSSSSSS
. - - . . - . - . . . . . .
1 1 3 1 3 1 1 3 1 1 3 3 1 1 3 1 1 3 1 1 1 3 1 1 1 1 1 7 = 50
^ ^ ^
^Intra-character ^Inter-character Inter-word^
```

So 5 words-per-minute = 250 counts-per-minute / 50 counts-per-word or one count every 240 milliseconds. 13 words-per-minute is one count every ~92.3 milliseconds. This method of sending code is sometimes called "Slow Code", because at 5 wpm it sounds VERY SLOW.

The "Farnsworth" method is accomplished by sending the dits and dashes and intra-character spacing at a higher speed, then increasing the inter-character and inter-word spacing to slow the sending speed down to the desired speed. For example, to send at 5 wpm with 13 wpm characters in Farnsworth method, the dits and intra-character spacing would be 92.3 milliseconds, the dash would be 276.9 milliseconds, the inter-character spacing would be 1.443 seconds and inter-word spacing would be 3.367 seconds.

** What is the standard phonetic alphabet?
Though no standard phonetics are required on amateur radio, good operating procedures include using the standard phonetic alphabet to help communicate more clearly. The recommended phonetics are those also in use by aviation (internationally by ICAO treaty) and some militaries (in most English-speaking countries.)
alfa bravo charlie delta echo foxtrot golf hotel india juliet kilo lima mike november oscar papa quebec romeo sierra tango uniform victor whiskey x-ray yankee zulu

The numbers are spelled differently to suggest a particular pronunciation. Also, nine was changed to "niner" to avoid confusion with the German word "nein" for "no", though that change is not commonly used by Hams. (Usually you'll only hear "niner" from Hams who are also pilots.)
zero one two tree fower fife six seven eight niner

When first making contact with another Ham, it is a good idea to say callsigns in phonetics to give the other side a better chance of understanding them correctly.

** I'm confused. What do all those abbreviations mean???
AM Amplitude Modulation
AMSAT Amateur Satellite Corporation [see rec.radio.amateur.space]
AMTOR Amateur Teleprinter Over Radio. A more sophisticated version of RTTY. Also used commercially as SITOR (Simplex Teleprinter Over Radio). [see rec.radio.amateur.digital.misc]
ARRL American Radio Relay League
ATV Amateur Television - a way to see who you're talking to!
CAP Civil Air Patrol is a volunteer organization that searches for downed aircraft and missing kids and uses frequencies just outside of the ham bands and often uses modified Amateur radios
CB Citizen's Band radio, this is NOT part of Amateur Radio and

does not require any license to operate [see rec.radio.cb]
CQ An on-the-air request for a conversation with anyone
"dupes" A dupe sheet is a duplicate check sheet, in matrix format, used
to quickly check that you have not had a "duplicate" contact
with someone (on a specific band or mode) in a contest
Elmer An amateur radio mentor, or "Master Craftsman" to a new ham.
Could refer to anyone, regardless of age or gender.
FCC Federal Communications Commission, the "law enforcers"
FM Frequency Modulation
FieldDay A June activity to practice emergency communications for
24 hours....wives call it 'an exercise in male bonding' :-).
HF High Frequency - 3 MHz to 30 MHz
HT Handy-Talky, a shorthand for "hand held radio"
LF Low Frequency - 30 kHz to 3 MHz
MARS Military Affiliate Radio System, military affiliated Amateurs
who provide free communications for overseas GIs and other
Federal services. MARS operators are licensed under DoD
instead of FCC.
NTS National Traffic System, a way to send radiograms
OF Old Friend, or Old F#$%, used to denote an older ham
OM Old Man, refers to any ham, including female hams
packet computer bulletin boards/electronic mail via Amateur Radio
[see rec.radio.amateur.digital.misc]
PRB Private Radio Bureau, administers Amateur and CB services
QSO One of the Q signals used in Morse code to mean "conversation"
QCWA Quarter Century Wireless Association, membership means you've
been a ham for more than 25 years
RTTY Radio Teletype - older form of computer communications on HF
[see rec.radio.amateur.digital.misc]
SAREX In Amateur Radio talk, Shuttle Amateur Radio EXperiment, a
chance to talk to astronauts in space. In CAP talk, Search
and Rescue EXercise, practicing for the real thing.
[see rec.radio.amateur.space]
SK Silent Key, a nice polite way to say a ham has passed on "to
that great antenna farm in the sky"
SSB Single Side Band - need less band width than AM or FM
SSTV Slow Scan TeleVision - REALLY slow, low data rate, typically
used on the lower frequency bands
SWL shortwave listening [see rec.radio.shortwave]
UHF Ultra High Frequency - 300 MHz and above
ULF Ultra Low Frequency - 30 Hz to 300 Hz
VHF Very High Frequency - 30 MHz to 300 MHz
VLF Very Low Frequency - 300 Hz to 30 kHz, audio frequencies
WARC World Administrative Radio Conference, a summit meeting that
occurs every few years, required by international treaty to
determine how the spectrum get sliced up to all vying
communications services (last one was in 1992)
XYL eX-Young Lady, or wife
YL Young Lady, non-ham girlfriend or female ham
2m Shorthand for "2 meters" (144-147.995 MHz), which is a

reference to the wavelength of a common Amateur frequency
band used for local communications

** What do all those "tones" mean?
Sub-Audible Tone: A low tone that you're not supposed to be able to hear. It's used as a "PL Tone." PL is "Private Line", a trademark of Motorola for their implementation of CTCSS (Continuous Tone Coded Squelch System). Basically, the transmitter sends the signal with the Sub-Audible tone and the receiver only opens when it hears signals with that tone. Signals without the proper tone are ignored. This is useful for "closed" repeaters, or for repeaters on the same frequency that have overlapping geographic areas.
Tone encode refers to the feature of providing the tone on transmit.
Tone decode refers to the feature of responding to the tone on receive.
Tone squelch refers to all of the above. DTMF refers to Dual Tone Multi-Frequency, or "Touch Tone" which is a trademark of AT&T. DTSS probably means Dual Tone Squelch System and refers to the feature of providing a predefined sequence of Touch Tone digits to open the repeater for transmit. DTSS is an alternate method from CTCSS, which provides a way to use a "closed" repeater even if your radio doesn't do Sub-Audible Tones.

** Where can I learn more about Amateur Radio if I live outside the US?
First, check if there is a Ham Radio-related newsgroup specific to your country. See the country-specific newsgroups in "the rec.radio.* newsgroups" in Part II of this FAQ.

Also, write to the ARRL and ask. They can usually tell you how to get a license in your country. See also the ARRL e-mail server. (Details are in Part 2.)

If you know of any location where this information is available electronically, whether by an e-mail server, anonymous FTP, or a contact person, please mail it to us so we can include it here. Send it to hamradio-faq@amdahl.com.

** How can I get a "reciprocal license" if I am a licensed ham from another country or if I am a FCC licensed ham who wants to operate in another country (on vacation)?
Editor's note (11/92): the regulations affecting this question are being changed. Contact your local Volunteer Examiner (VE) and ask about a VE 60-day pass. More details will be included in future revisions of the FAQ.

This paragraph is soon to be obsolete:

You need to submit a FCC Form 610-A to the FCC, PO Box 1020, Gettysburg, PA 17326. They will then send you a reciprocal permit for alien amateur licensee (FCC Form 610-AL). You must be a citizen of a country with which the United States has arrangements to grant reciprocal operating permits to visiting alien Amateur operators.

This information is still current:

For FCC licensed hams operating abroad, the following guidelines apply:
* A reciprocal license is required in all foreign countries (that have a reciprocal operating agreement with the US), except Canada, where the FCC license is automatically valid.
* Send a SASE to ARRL Regulatory Information Branch, telling them which country you are going to visit and they will send you the info and an application form. Foreign hams can likewise request information from their national Amateur radio society.
* Submit your application with a certified copy of your Amateur license (ie, notarized copy), and fee if applicable (use a bank draft of a bank that does business in that country) to the appropriate licensing administration of the foreign country. Processing may take 30 to 90 days.
* If less than one month, you could try sending the application and pick up the permit upon arrival in that country.
* Most countries will not allow you to bring communications equipment into their country without a license or permit. If you applied, but haven't received the permit yet, show the copy and your FCC license to the customs officer, however, the equipment may still be held at customs until your departure.
* Be sure to use only those frequencies covered by your FCC license which are also used in the foreign country, unless otherwise authorized.

See also the file RECIP-OP on the ARRL e-mail server. (See Part 2.)

** My apartment or housing complex does not allow outdoor antennas, now what do I do?
[see also rec.radio.amateur.antenna]
First of all, don't despair. Many hams have similar problems. Many books offer advice for the growing group of hams that cannot put up antennas. Some options are:
* Install an "invisible" antenna made of magnet wire.
* Disguise an antenna as a flag pole.
* Install an antenna in the attic.
* ASK the apartment manager. You may find they will let you put up something as long as it "is invisible" or "doesn't disturb your neighbors" or "doesn't attract lightning".
* Operate primarily from your car.
* If the restriction is due to local ordinance, you may have relief via PRB-1. Meet with the local government and seek an informal compromise. It is possible to win in court...but it's expensive and time consuming.
* If you are restricted by "covenants" attached to the deed of your home, your options are severely limited. Covenants are considered to be private, voluntary contracts between individuals and are outside of the intended application of PRB-1. In many cases, you can petition the Homeowner's Association for an exception. Sometimes you can win in court on the basis that other violations of the covenants by others without action taken constitutes abandonment of the agreement.

* For further information, contact the General Consel's office of the ARRL, 225 Main St, Newington, CT 06111.

See also the file ANTS-INDOOR on the ARRL e-mail server.

** I got TVI...HELP!!!
Here's some hints on Television interference, but this is not a complete list. There are also books on the subject available from ARRL.
* If cable TV is an underground feed, look for central distribution box. Check for a grounding rod.
* Try installing torroids on the cable TV cable close to the TV, and maybe torroids on the AC cord as well.
* VCRs are notorious for RF leakers, try disconnecting the VCR.
* Check to see if interference is better or worse when cable is disconnected and you use rabbit ears instead. It could be the cable company's problem!
* Calling the cable company may get results, since they are also responsible for RF leakage from their equipment. However, they are very often obstinate. Good luck! Try some or all of these suggestions before calling the cable company:
1. Log the interference, noting geographical location, frequency, and characteristics.
2. Bring it to the cable company's attention in writing, preferably addressed to "Chief Engineer", or "Technical Staff".
3. Don't be accusatory, instead ask for assistance in resolving the problem. Try to work it out with someone technically knowledgeable.
4. Do mention your "licensed radio system", but try not to be too specific about "ham" or "CB" unless requested.
* Try moving the radio antenna further away from the TV sets. Make sure the SWR is LOW.

See also the series of files on the ARRL e-mail server on various aspects of electromagnetic interference. The filenames start with "EMI-" like EMI-CATVI (cable TV), EMI-GEN (general notes on EMI), EMI-AUDIO (interference to audio devices), etc.

** Did you know that you can get college credit for being a ham?
It's true! You can receive up to 14 credits in electronics and engineering thru placement tests for CLEP (College Level Entrance Placement) exams and DANTES (Defense Activity for Non-Traditional Educational Support) exams if you have an Advanced or Extra class Amateur license. For more information, ask your campus education office or (for DANTES) your military education office.

** On what frequencies do JPL and GSFC retransmit the shuttle audio?
[see also rec.radio.amateur.space]
Station VHF 10m 15m 20m 40m 80m Video
WA3NAN 147.45 28.650 21.395 14.295 7.185 3.860
W6VIO 224.04 21.280 14.282 7.165
K6MF 145.585 7.165 3.840

W5RRR 146.64 28.495 21.350 14.280 7.227 3.850
W6FXN (temporarily out of service - looking for new frequency)
KA9SZX 146.88 426.25
K4GCC 146.94
WA4VME 145.17
W6TRW 145.32

All frequencies are in MHz. Use FM on VHF, USB on 10-20m, LSB on
40-80m.
WA3NAN - NASA Goddard Space Flight Center (GSFC), Greenbelt, MD
W6VIO - NASA Jet Propulsion Laboratory (JPL), Pasadena, CA
K6MF - NASA Ames Research Center (ARC), Moffett Field, CA
W5RRR - NASA Johnson Space Center, Houston, TX
W6FXN - Los Angeles, CA
KA9SZX - Champaign-Urbana, IL
K4GCC - Titusville, FL (near or at Kennedy Space Center)
WA4VME - Melbourne, FL (near or at Kennedy Space Center)
W6TRW - TRW ARC, Redondo Beach, CA (shuttle audio may be overridden
by repeater usage)

** Can I take my HT on an airplane and operate it if I get the permission
of the captain?
Technically, maybe. But don't count on it. In general, you can't use
a radio or scanner on an airline (or charter) *unless* the airline
allows it and the pilot-in-command (PIC) determines that it will not
interfere with the instruments and radios on that specific aircraft.
Very few US airlines allow passengers to use radios so be ready to
disconnect the antenna when you ask. (Don't even ask to transmit.)
For reference (in the US) the pertinent portion of the Federal Aviation
Regulations (FARs) is Part 91, paragraph 91.21.

Due to airport security, you may have a little difficulty carrying the
HT (or any electronic equipment) onto the airplane. Generally, you
can appease the security guards, simply by showing that the unit is
operational and doesn't have a bomb inside. For a radio, just turning
it on and opening the squelch satisfies them. Expect more difficulty
during periods of increased security.

On a private airplane, it is legal to operate an amateur radio if you
have the permission of the PIC. It is still possible for the radio to
interfere with the plane's navigation or communication equipment, so
be sure to ask first. Always obey the requests of the PIC. He knows
his airplane and radios better than you do.

** How do I modify my current Amateur license?
To modify your license (change of address, change of station location,
change of name, renewal, or even change of callsign), submit an FCC
Form 610 to the FCC. Forms are available from the FCC or ARRL or a
local VE session or ham radio store. Do NOT use a photocopy. Check
off the appropriate boxes, fill in the new/changed information, SIGN
THE FORM, and attach a copy of your current license (or a brief letter
of explanation for its absence, ie, "my dog ate it"). NOTE: If you

check the box to change your callsign, YOU WILL GET A NEW CALLSIGN, even if all you wanted was to supply a new address; if you want to keep your callsign, DON'T CHECK THAT BOX. Send the form to FCC, POB 1020, Gettysburg, PA 17326. Turnaround time (for CURRENT licensees only) is about 2-4 weeks.

ANY ham can apply for a new callsign (this is different from the past where you can only get a new callsign if you move or upgrade). You can't specify WHICH ONE you want, a new one comes from the same pool as new licensees for that class of license. The callsign is based on your mailing address. For overseas military and civilians, be sure to specify a station location that is within FCC jurisdiction.

New licenses are for 10-year terms. If you apply for renewal before its expiration date, the expired license is valid for 60 days after expiration to allow for the new license to arrive. You have up to 2 years after expiration (5 years for an old 5-year license) to renew before re-examination is required (but you can't operate with an expired license). You will lose your current callsign after 1 year after expiration if you don't renew.

For more information on FCC Form 610, see the file FCC-610-INFO on the ARRL e-mail server. (See Part 2 for details.)

** I'm confused about XXX, should I ask the FCC?
[see also rec.radio.amateur.policy]
Whatever "XXX" is in this case, the overwhelming ARRL and net opinion is a resounding "NO!", at least not as a first step. Amateurs are generally very law-abiding people and have historically written the FCC asking for clarification on some operating practice or another. This is a very dangerous practice, for several reasons.

Most amateur radio regulations (contained in Part 97) are generally very loosely-worded, so as not to restrict experimentation and new techniques. But asking the FCC for a clarification will set in motion the process of "clarifying" it for everyone (i.e. new rulemaking.)

Examples of such restrictive rulings include varying topics like when Hams can help non-profit agencies or effectively forcing packet BBS sysops to screen messages before forwarding them. They were the result of well-intentioned questions by Hams that forced the FCC to make a ruling where they previously allowed the amateur radio community to police itself.

Under all circumstances, it is better to first read the rules yourself. Then, if there's a problem, ask your national amateur radio organization (such as the ARRL in the US) which can give qualified advice about interpretation of FCC regulations. Organizations like the ARRL also have the influence to ask the FCC informally, without forcing a ruling.

Even if asking the FCC doesn't result in a restrictive ruling, it is generally a good idea to not overburden an under-staffed and under-funded government agency with a lot of correspondence. The Amateur

Radio Service has traditionally been a low-workload "hands-off" service, and has enjoyed a wide latitude from the FCC. Please don't ruin this image for your fellow amateurs.

For more discussion on how and when to contact the FCC, see the file FCC-CONTACTING on the ARRL e-mail server. (See Part 2 for details.)

** Is there any information on antique radios?
Antique radio classifieds: ARC, PO Box 802-B6, Carlisle, MA 01741 - old radios, TVs, ham equipment, 40s and 50s radios, telegraph, books, etc.
Hallicrafter Service manuals: Ardco Electronics, PO Box 95, Dept Q, Berwyn, IL 60402
Antique Wireless Association, Bruce Kelley, W2ICE, Route 3, Holcomb, NY 14469 - sponsors the Wireless Museum

** Where can I buy vacuum tubes?
Kirby, 298 West Carmel Drive, Carmel, IN 46032 (1-317-843-2212)
Antique Electronic Supply, Box 1810, Tempe, AZ 85281 (1-602-894-9503)
Fair Radio Sales, Box 1105, Lima OH 45802
Fala Electronics, Box 1376-1 Milwaukee, WI 53201
Southern Radio Supply, 1909 Tulane Ave, New Orleans, LA 70112 (10504-524-2343)

See also the file VACUUM-TUBES on the ARRL e-mail server. (See Part 2)

** What do I need to get started in packet radio?
[see also rec.radio.amateur.digital.misc]
Packet radio is a digital form of communication using radios. There are OTHER digital forms, as well, like CW, RTTY and AMTOR. To use packet radio, you'll need a radio (2 meters and 70 centimeters are most popular), a box that converts radio signals to digital signals that a computer can understand (called a TNC or terminal node controller) and a computer or terminal. For some computers or TNCs you may need special software as well. However, most TNCs and computers get along quite well with just a terminal emulator software package. Most personal computers can be interfaced to use with packet radio. Since there are many digipeaters, generally even an HT will work with packet radio.

Your first source of information on Packet Radio should be the rec.radio.amateur.digital.misc newsgroup. It has its own regularly-posted FAQ that goes into much more depth on the subject than this one can. See also the mailing list and archives info in Part 2.

For more information on packet radio, you might try TAPR (Tucson Amateur Packet Radio), PO Box 12925, Tucson, AZ 85732 (602-749-9479).

See also the files PACKET-INTRO, PACKET-NEW, and PACKET-GLOSSARY on the ARRL e-mail server or the directory /hamradio/packet on the KA6ETB e-mail HAM-server. (See Part 2.)

** What do I need to get started in satellite communications?
[see also rec.radio.amateur.space]
For more information about Amateur Satellite Communications, try AMSAT (Radio Amateur Satellite Corporation), PO Box 27, Washington, DC 20044 (301-589-6062). They also have an international net on Sundays on 14.282 MHz at 1900Z.

ARRL publishes a book on this subject: The Satellite Experimenter's Handbook. Ham Radio stores in your area may either have it or be able to order it. Or you can order it direct from ARRL.

See also the contents of the directory /hamradio/satelite on the KA6ETB e-mail HAM-server. The ARRL e-mail server has a bibliography on satellite materials in the file SATELLITES-B.

** What is available to get started in ATV, SSTV and WEFAX?
This is a large subject area in itself. Amateur Television (ATV), Slow-scan TV (SSTV), and Weather FAX (WEFAX) all deal with transmitted pictures. (ATV includes moving pictures and audio just like your household TV.)

Equipment is available to interface to most common microcomputers including PC clones, Amigas (which are prominent in most video applications anyway), Atari ST, and others. (At last check, we didn't see Macintosh on the list.) There are also a handful of publications on the subject.

All this information is available via FTP in the /pub/ham-radio directory at ftp.cs.buffalo.edu. (See Part 2 for more information on FTP.) The file called sstv_wefax_info is maintained by John Langner WB2OSZ (johnl@avs.com).

The ARRL e-mail server contains an introduction to SSTV in the file SSTV-INFO. (See Part 2 for more information on the ARRL e-mail server.) There is a bibliography of ATV articles from QST in the file TV-B. (See Part 2 for details.)

The KA6ETB e-mail HAM-server has files on SSTV and WEFAX in the directory /hamradio/sstvfax.

Another resource is the regularly-posted UseNet Elmers Directory. The list contains a volunteer Elmer who can help with ATV, SSTV, and WEFAX questions.

** What are these contests I sometimes hear, and how do I participate?
Dozens of contests are held each year, usually at weekends, and can provide useful operating experience. They typically last for 24 or 48 hrs, and are usually on SSB or CW only (the Russian CQ-Mir contest is on both modes at the same time). You can participate by making one QSO or several thousands. In most contests you send a signal report (traditionally 59 or 599) followed by a number that is different for different contests - the most common one is a serial number (so you send 599 001 for your first QSO, then 599 002 etc). The exchange may, however, be your age (All Asian contests), your CQ or ITU zone (CQWW

and IARU contests, respectively), your state (ARRL contests) or something else. Read "Contest Corral" in QST for the rules for all major contests - the more serious contester may wish to subscribe to the National Contest Journal, or join the e-mail contest mailing group (write to Trey, WN4KKN, at garlough@tgv.com). Knowing the rules can prevent embarrassment - you will get a cool reception if you are a W or VE and call a W/VE in the ARRL contests, since they can only work non-W/VE stations. Otherwise, QSOs made in contests are just as valid for DXCC (DX Century Club - more than 100 contacts), WAS (worked all states) and other awards as are 30-minute ragchews. Although not strictly a contest, the annual Field Day provides very useful operating experience under less than optimal conditions and is highly recommended for new operators - check with your local club for their Field Day plans some weeks before the (late June) event.

For more information on contests, the ARRL e-mail server has the following files: CONTESTS-93 (as of this writing, substitute current year), CONTEST-LOGS (for contest log formats), FORM-10M (10m contest entry form), FORM-VHF (VHF contest entry form), and others.

2970. Re: VOA Internet Audio Debuts Aug. 15

>|> > So, if we are in the states, we technically cannot download the files?
>|>
>|> Or tune the radio to VOA?

I called our US Information Agency office here in Honolulu a few years ago and asked them to send me the VOA's bcst schedule; they said `No - the VOA bcsts are not meant for domestic reception.' Only after I explained that I was going to Viet Nam did they say `In that case, then we CAN send you the schedule.' They explained their bcsts are meant for both foreign listeners and overseas Americans.

I called 73 magazine one day on just a whim and asked to speak with Wayne Green. They said he wasn't there but home at his ranch working on a book. They asked if I wanted his home phone number! I said sure and they gave it to me! So I called him and lo and behold he answered me on his speaker phone. I expected a grumpy old opinionated self rightous egocentric ham! What I got was a very nice pleasant conversation with him. He chuckled when I told him what I expected him to be like. He said a lot of people get that impression of him from his editorials. Oh he does have his opinions but don't we all? He said he writes those editorials to get us to think and by golly I think he's managed to get us to think a bit now and then! I did enjoy my conversation with him and would love to talk to him again. He was very gracious and took the time to chat with me when I sure he has other things to do. That in itself is a point in his favor. Wayne and I are on opposite ends of the political spectrum and I don't agree with him all that often but at least he makes me think about why I don't.
73!
Jeff

I'd worry more about living near broadcast towers. Both the EPA and FCC conducted a joint study here in Honolulu to determine why there was a significant above-normal rate of lukemia in residents living near a bcst tower containing 3 AM bcst transmitters (yes Gary, this is commonly done here in Honolulu - the folks on rec.radio.broadcasting will explain how it's done). The upshot of the study was that the tower was dismantled (but not before some local hams hooked up a 160M xmtr to it!).

Honolulu has the distinction of having the highest RF backround radiation level than any other city in the nation. AM towers sit in residential and commercial districts; FM and TV towers sit atop highrise hotels and office buildings. The window washer at my dad's condo used to draw sparks between his scaffolding and the window frames (a 3-transmitter AM bcst tower was 50 yards from the building, which, after years of the residents petitioning the FCC and tower owner, was finally moved).

The reason we have such a high level of RF is that 90% of the state's 1.1 million population reside in Honolulu (nation's 11th largest city) - that makes us a sort of city-state (similar to Singpore?) - so all the broadcasters (and there are lots!) have located their towers in this one and only city of the entire state.

>>Questions I have:
>>

>>First, does anyone know when this will come, or even equal 50% of
>>such calls?

Here in Europe the GSM system is developing very rapidly. In fact faster than
anyone has ever predicted.

> ..... And, as now but
>even more so, the service providers will subsidize the cost of the
>phones to encourage customers to switch over. Note too that the
>providers are primarily interested in the heavy business users of
>cellular phones. That's where the money is, with high monthly usage.
>If they cut off some customers who don't use the service much by
>shutting down the analog nets, they won't cry about that. There's
>no universal service mandate for cellular.

This is exactly what has happened here in Denmark. The old analogue net NMT
(Nordic Mobile Telephone) was monopolized, but for GSM, there are two
operators fighting for market shares. This has led to extreme cases
where some of the older (first generation) GSM phones was actually
given away or sold at very very low prices together with a subscription.
It actually went so far, that the authorities has to introduce limiting rules
for this subsidarazion. It was feared that in the end the subscribers
would have to pay for the competition.
But still you can get a new digital GSM phone for around 3000 DKK
(about $400).

>>And if digital becomes
>>a standard, will there be a new generation of 'digital scanners', able
>>to detect digital, and translate it?

>No. Intercepting cellular calls is illegal now, there won't be scanners
>legally sold to decode digital cellular in the future unless the ECPA
>is repealed (very unlikely).

In fact European police has got a problem now. Even with a court order,
they are not able to intercept GSM conversations. This is because
there has not been developed equipment for this. The companies
certainly don't see any interest in financing such a development, and
the authorities has really been sleeping.

However, expect the analogue nets to stay for some time. Here in Denmark Telecom who runs the old analogue NMT systems and one of the GSM nets are trying to market the NMT system for private customers. This is done by the introduction of low subscription rates and reduced call charges outside business hours.

I have been a 73 reader since the mid Sixties and have found Wayne Green W2NSD/2 interesting, entertaining and controversial. He's Ham Radio's original "Bad Boy". Every organized effort humans involve themselves in should have a "devil's advocate" or whatever you wish to call it.

Two political parties are better than one. The ARRL is necessary as a lobby group to keep the Bureaucrats in DC from taking our bands away from us (especially the VHF-UHF bands which are jealously coveted by the two-way radio industry. Don't forget the 220MHz band that UPS spent mucho bucks to get from us and doesn't even use!) In my opinion, Wayne is and has been the guy that keeps the League on its toes.

I've heard Wayne Green speak on several occasions at hamfests and he always draws a huge crowd. Many people criticize him for all kinds of reasons. I don't always agree with his views, but he certainly makes the political side of our hobby colorful and interesting.

A.N.A.R.T.S. News Bulletin 823 21st August 1994

News is more than a bit scarce this week, and we will be on
the lookout for better news for next week.

Perhaps you have some news from your club that will be of
interest to other clubs in this country -- is your club about
to have a contest, or perhaps a field day? We would be glad to
hear from you and spread the word to others. We want to help
your club with publicity so think of us when next an event is
happening in your area. Send to Pat, VK2JPA at VK2AAB, and
watch it go Australia-wide, and better.

Hope you are participating in the SAARTG RTTY contest today.
Keep the VK callsign up on the scoreboard. Best of luck.

IPS weekly report

12 August - 18 August 1994

Issue No 33
Date of issue: 19 August 1994

INDICES:

Date 12 13 14 15 16 17 18
10cm 81 84 89 81 77 78 77
A 19 24 26 11 10 8 (8 estimated)
T 15 17 18 7 20 21 18

SUMMARY OF ACTIVITY

Solar activity was very low on 12th, low on 13th and 16th, and moderate 14th-15th and 17th-18th August. An M3 flare was observed on 14th, and 1 M1 flare on 15th, and 17th, and 2 M1 flares on 18th August. A short wave fadeout was observed in association with the M1 flare on 17th, and again with the first flare on 18th.

The geomagnetic field at Learmonth (WA) was mostly quiet to unsettled, except for 13th-14th when the field was unsettled to active. There was a minor storm 0400-0700 UT on 13th.

Ionospheric F2 critical frequencies at Sydney were near predicted monthly values except for 15th August when values were about 15 per cent below predicted monthly values. Spread F was observed on 12th, 13th and 15th August, with Sporadic E also observed on 12th.

FORECAST FOR THE NEXT WEEK (19 - 25 August)

SOLAR: Low

GEOMAGNETIC: Mostly quiet to unsettled, with active levels expected on 24 August

IONOSPHERIC: Near predicted monthly values.

NOTES OF INTEREST.

MOUNT ATHOS, SV/A. MONK APOLLO CAME ON FIRST RTTY IN LONG TIME AT AROUND 1330 ZULU, SUNDAY 7 AUG. MOST ALL CONTACTS WERE WITH EUROPE AND JAPAN WITH ONLY ONE STATE SIDE CRACKING PILE UP. THE OPERATION WAS ON SAME QRG, NO SPLIT MAKING IT DIFFICULT. FROM ALL REPORTS A THANK YOU IS IN ORDER TO DOMINIK, DL5EBE FOR SHIPPING 46,000 OF SOLAR CELLS, BATTERIES AND AN ICOM 735 FOR THE NEW MONASTERY.

SUDAN, ST. LUIGI, ST2AA HAS A TEMPORARY STATION FROM HOME BEFORE HOPEFULLY SETTING UP WITH HIGH DIPOLE AT THE UNIVERSITY OF AFRICA WHERE HE HOPES TO HAVE A MAILDROP OPERATION, ST0K. HE IS ONLY QRV ON 20 METERS AND HAS SIMPLE EQUIPMENT, THE ICOM 735 RUNNING ABOUT 50 WATTS. THE TNC IS SCS PTC-PLUS AND OLD SMALL PX8 COMPUTER WITH 32KB MEMORY. LUIGI HOPES THIS WILL HELP THOSE NEEDING SUDAN FOR FIRST TIME IN PACTOR MODE. QSL INFO, AIRPORT P.O.B. 73, KHARTOUM INTERNATIONAL AIRPORT, SUDAN, AFRICA.

FOR NEXT WEEK'S BULLETIN, SEND YOUR BANDPASS AND NOTES OF INTEREST TO JULES, W2JGR AT W2TKU.#SRQFL.FL.USA.NA OR W5KSI.#NOLA.LA.USA.NA

REMEMBER, DX DON'T SLEEP.
GL DE BOB, WB2CJL AT W5KSI.#NOLA.LA.USA.NA

DX BULLETIN 50 ARLD050
FROM ARRL HEADQUARTERS
AUGUST 12, 1994
TO ALL RADIO AMATEURS

THE ITEMS IN THIS WEEK'S BULLETIN ARE COURTESY OF STEVE, W9NUF, THE WESTERN ILLINOIS DX ASSOCIATION, BOB, W5KNE, THE QRZ DX NEWSLETTER, TED, KB8NW, THE OHIO/PENN DX BULLETIN, AND THE CONTEST CORRAL COLUMN FROM QST. THANKS.

CENTRAL KIRIBATI. T31BA AND T31BB HAVE BEEN ON THE AIR A LOT LATELY. LISTEN FOR THEM ON 3795 KHZ BETWEEN 1030 AND 1200Z. ALSO TRY 40 METER SSB FROM 0600 TO 1300Z AND 20 METER SSB BETWEEN 2200 AND 0400Z. QSL T31BA VIA DL2ZAD. QSL T31BB VIA DF6FK.

SAINT KITTS. V44KAO HAS BEEN QUITE ACTIVE IN RECENT DAYS. HE WAS WORKED ON 7006 KHZ AT 0100Z ON WEDNESDAY.

SAINT PAUL ISLAND. THE CY9DX DXPEDITION HAS BEEN CANCELLED.

SINGAPORE. THE SPECIAL PREFIX S61 WILL BE USED BY AMATEURS THROUGH SEPTEMBER 12. THIS IS IN CONJUNCTION WITH THE 25TH ANNIVERSARY OF THE FOUNDING OF THE SINGAPORE AMATEUR RADIO TRANSMITTING SOCIETY.

HONG KONG. TOM, VR2GC, IS ON THE AIR MOST WEEKENDS. CHECK AROUND 14015 KHZ BETWEEN 1230 AND 1530Z. QSL VIA G5JJ.

MALAWI. ELISEO, IN3VZE, IS ACTIVE AS 7Q7CE UNTIL AUGUST 25. QSL VIA IN3VZE. JOHN, 7Q7JL, HAS BEEN WORKED ON 18155 KHZ BETWEEN 1300 AND 1530Z. QSL VIA G0IAS.

NEPAL. KYOKO, NH6RT, HAS BEEN HEARD SIGNING 9N1KY. SHE WAS HEARD ON 14184 KHZ AT 1648Z AND 14270 KHZ AT 1700Z. QSL VIA KYOKO YAMAKAMI, BOX 3, TOKAIMURA, 319-11, JAPAN.

CHAD. LARRY, F5IXR, IS PLANNING TO BE ON THE AIR BEGINNING AUGUST 18 SIGNING TT8/F5IXR UNTIL HE RECEIVES HIS TT8 CALL SIGN. TT8XR HAS BEEN REQUESTED. QSL VIA F5MXH. NO DOCUMENTATION HAS BEEN RECEIVED FOR THIS OPERATION.

EASTERN MALAYSIA. DAVE, 9M8BT, CONTINUES TO BE ACTIVE ON 20 METER SSB WITH A VERY GOOD SIGNAL INTO THE EAST COAST. HE WAS ALSO HEARD ON 20 METER RTTY. BEST SHOTS ARE BETWEEN 1245 AND 1500Z. QSL VIA N5FTR. JOHNNY, 9M8DB, ALSO HAS A GOOD SIGNAL AND OPERATES AROUND THE SAME TIME AS DAVE. QSL VIA JOHNNY TAN, BOX 1549, 98008, MIRI, SARAWAK, EAST MALAYSIA.

CHAGOS. VQ9TP HAS BEEN DOING A LOT OF CW ON SEVERAL BANDS. MOST ACTIVITY IS BETWEEN 1230 AND 1630Z. HE WAS HEARD OVER THE WEEKEND ON 18083 KHZ BETWEEN 1345 AND 1600Z. ALSO CHECK THE LOW END OF THE OTHER BANDS. QSL VIA N5TP. TOM, VQ9TT, WAS HEARD ON 14014 KHZ AT 1300Z.

AMSTERDAM ISLAND. FT5XJ HAS BEEN SIGNING FT5ZF, WORKING MOSTLY ZLS, EUROPEANS, JAS AND WESTERN USA. QSL VIA F5NLL.

TOKELAU ISLANDS. 5W1UC IS SIGNING ZK3UC. QSL VIA BOX 615, APIA, WESTERN SAMOA.

GREENLAND. KARL, OX/DL1VU, SHOULD BE ON UNTIL AUGUST 25. HE PREFERS OPERATING CW. QSL VIA DL1VU.

SUBSCRIPTIONS.

Members are reminded that ANARTS Financial Year commenced on
1st July 1994 and that subscriptions are now due. We have had
a freebie for 12 months as a gesture to our members but it
could not continue that way for ever.

So please send $10 (you know, the pretty blue note) to our
Secretary who will process it under our new system which
should prevent delays and transit problems.
Send to the official ANARTS address at Box 860, CROWS NEST.
NSW. please.

Society information

The Society may be contacted at : PO Box 860, Crows Nest 2065
Australia, for such matters as membership and general
enquiries. Enquiries can also be made by packet to the
President (Col) VK2CTD, or the Secretary (Pat) VK2JPA at
VK2RWI.

News items may be sent to Broadcast Officer PO Box 60
Blacktown 2148 Australia, or by packet to VK2JPA at VK2RWI.
Email addresses for the Broadcast Officer are :

patl(at)pitt.conmusic.su.oz.au

The Society welcomes news items on any digital subjects from
anywhere in the broadcast coverage area. We know we reach New
Zealand and many South Pacific islands, and we were reaching
as far north as Japan when conditions were right. We are
looking forward to news from your areas to let other amateurs
know what you are doing in the hobby. Hope to hear from you.

73s de Pat VK2JPA Broadcast Officer
That concludes the broadcast for this morning/evening.

** PRESIDENT'S MESSAGE **

This is Michael Corbin, VK2PFQ.

As I told you last week, there was a meeting of the "Council" last Friday evening the 19th August. The prime purpose of this meeting, was to discuss a motion, prior notice of which had been given. To refresh your memory this motion was (with a couple of addendums), "That this meeting instruct the Divisional Barrister to proceed as per the advice of the 27th July, 1994, from Messrs. Lewarne and Goldsmith of Parramatta" and that voting be by, a show of hand."

Allegations were made by Roger Harrison in a written statement, presented at the meeting that Michael Corbin had presented the Barrister with "questions and propositions". He concluded that, and I quote, "the clear conclusion can be drawn that the advice sought arose from "the Concerned Amateurs Group". THIS IS NOT TRUE!

His further conclusion was that I was guilty of an offence under Section 232(6) of Corporations Law. This section has absolutely as much relevance as a Thesis on the Likelyhood of fitting 6 round pegs into 4 square holes, I'll quote it nevertheless:

"232(6) (NO GAIN BY IMPROPER USE OF POSITION) An Officer or employee of a corporation must not, in relevant circumstances, make improper use of his or her position as such an officer or employee, to gain, directly or indirectly, an advantage for himself or herself or for any other person or to cause detriment to the corporation."

I ask you what possible gain could there have been to me personally .... what possible advantage could I have expected to gain for myself ..... and finally what detriment could I have caused to the corporation.

Lets run them again...
(i) What possible gain could there have been to me personally.....
Answer....NONE!

(ii) What possible advantage could I have expected to gain for myself.....
Answer.....NONE!

(iii) What sort of detriment could I have caused to the corporation.....
Answer.....NONE!

To infer that I obtained any advice other than for the benefit of the Wireless Institute of Australia N.S.W. Division is scandalous.

To suggest that I have acted other than with the best interest of the Division and the hobby is wicked. I intend to forward Mr Harrison's allegations of "IMPROPRIETY" to the Solicitor for his information. If trying to do the RIGHT THING by the Division is my crime then..... I AM GUILTY!

I do not propose to discuss this any further until next week. I am far too tired at this point in time ....Remember I am trying to earn a quid and...at the same time fight a rearguard actions against a group of Councillors who, in my opinion, seem hell bent on the destruction of the Wireless Institute. The sooner this nonsense is over the better.

The motion was decided on the casting vote of the Chairman.

In conclusion I advise that the three Federal Councillors who represented this Division have been replaced as they ..."no longer have the Confidence of the Council of this Division"...but more of this next weekend.

See you then.

WICEN News

Users of the Sydney WICEN repeaters are asked to be patient whilst a problem is being sorted out; it appears that since the re-commissioning of the system a rogue pager on 2m and a wide-band signal on 70cm have appeared.

The VRA Annual Conference, celebrating 25 years, will be held at Wagga on the weekend of 8-9th October. At this conference Max Walters will step down after 25 years as President, so a large attendance is expected. There will be a Dinner on Saturday 8th October, and an informal gathering on Sunday 9th. There is also a family outing on Saturday whilst delegates are at the conference. Any WICEN member wishing to attend should contact the State Co-ordinator, John Howard VKn@MH on (02) 477-6616, by letter to his Call Book address, or the WICEN Co-ordinators conference will be held at Bathurst on the weekend of 29-30th October. The format will be primarily a training Seminar with emphasis on Regional administration, and Operations with a short business session. All members are invited, and they will be able to contribute towards its success. Further anformation will be given on a later Broadcast.

The Windsor-Sackville Regatta is next Saturday; contact details are scanty at the moment, but interested personnel may contact John Buxton VK2GJB.

Looking ahead to future events, don't forget the "Hawkesbury Classic Paddle" on the weekend of 22nd-23rd October. As before, Kevin VK2CKD is in charge, and he advises that packet radio will be tried for this event.

Those regions wishing to have their activities publicised on this broadcast are requested to get the details to the Publicity Officer, Dave VK2KFU, by Thursday night at the latest. Packet radio is the preferred medium, to either VK2AAB or VK2OP BBS, and all items are promptly acknowledged.

WICEN (NSW) Inc. operates a telephone BBS, are at speeds from 300 to 14,400 bps on (02) 888-2763. Brett VK2XMU is the "Sysop", and all listeners are invited to use it. Many programs, such as "virus scanners" and "PGP", are available for downloading.

-- Dave VK2KFU, WICEN (NSW) Inc. Publicity Officer

Magazine Roundup

Here again is a summary of the local magazines, which in the author's opinion could be of interest to Amateurs.

"Electronics Australia" has an article on how Pay-TV signals are scrambled; short-wave listeners will find some practical advice on getting the most from their receivers; a simple gel-cell charger is presented; and details of a wide-band noise source are given.

"Silicon Chip" mixes the old and new with a microprocessor-controlled Morse keyer; and builds a simple crystal checker and a Ni-Cad "zapper".

"Amateur Radio" builds a beam antenna with bent elements; discusses an 80m antenna for a confined location and an unusual multi-band antenna; and shows the effectiveness of a pager notch filter.

"Amateur Radio Action" discusses multi-band vertical antennas; and modifies a TS-680S for an all-mode squelch. Packet radio users may find the article on PGP authentication to be of interest.

Be listening next month for another summary of the local magazines.

-- Dave VK2KFU

2nd Annual South Australian Technical Symposium

The second annual South Australian Technical Symposium is to be held on Saturday September the 17th in Adelaide at the Onkaparinga Insitute, O'Halloran Hill Campus (formerly the Kingston College of TAFE), Majors Road, O'Halloran Hill. This event presents a series of lecturers on various technical aspects of Amateur Radio and the Electronics and Communications industries. Topics this year include:

Key Note Speakers:

How cellular telephones work Telecom Australia
The Spectrum Management Agency SMA Adelaide

General lectures:

FM ATV equipment construction and operation David Minchin VK5KK
FAX and SSTV using your home PC Colin McCarthy VK5EB
Electronic test equipment & measurements Mark Spooner VK5AVQ
HF antennas Rob Gurr VK5RG
HF QRP operation & equipment Bernie Samuel
EME communications Al Rechner VK5EK
The TPK Packet Radio terminal Rod Baker VK5ZTV
TCP/IP, The Internet and Amateur Packet Radio Steve Fraser VK5ASF
An introduction to microprocessors Peter Cockburn VK5TZX

The general lectures are held in three streams. Lunch, Morning tea and Afternoon tea are all provided and everyone who attends will receive a copy of the symposium.

The doors open at 9.00am with the first lecture starting at 9.30am. It should finish around 5.30pm.

Last year this event was very popular with people attending from around Australia including Perth and Melbourne. Many also came to Adelaide from Country SA.

If your club members wish to book tickets or would like more information you can contact Grant Willis either by post at 'SA Tech Symposium, PO Box 333 Morphett Vale SA 5162' or by telephone on (08) 277-3077 between 7.30pm and 9.00pm CST. Tickets are available for $20 ea. Last year all the seats were snapped up very quickly so get in early! Payment can be made by way of cheque or money order to the South Coast Amateur Radio Club Inc.

I hope to see you all in Adelaide on September 17th!

Yours sincerely
Grant Willis Club Secretary

ABC launches new radio

A new all-news radio station has just appeared on the AM medium wave broadcast band with news updates every 15 minutes. News Radio is a station of the Australian Broadcasting Corporation, will be live on air initially for six hours a week using the facilities of the Parliamentary News Network. At other times a programme explaining what News Radio is about is being transmitted continuously.

The station format will feature news from Radio Australia, the BBC World Service, CNN and other sources will be some of the input information. In a break with tradition, all the presenterss are journalists themselves. The station boasts that it is making use of the recently developed DCAR, Digital audio system, which allows rapid high qulaity editing of news stories which are updated throughout the day.

The station will be broadcasting from all capital cities except Darwin, plus Newcastle and Canberra. Listeners will be able to keep up to date with the latest news wherever they are. The station

frequencies they are using:

in Sydney 630KHz
Melbourne 1026Khz
Canberra 1440KHz
Newcastle 1458KHz
Brisbane 936KHz
Hobart 729KHz
Adelaide 972KHz
Perth 585KHz

IPS weekly report
---
12 August - 18 August 1994

Issue No 33

Date of issue: 19 August 1994

INDICES:
Date 12 13 14 15 16 17 18
10cm 81 84 89 81 77 78 77
A 19 24 26 11 10 8 (8 estimated)
T 15 17 18 7 20 21 18

SUMMARY OF ACTIVITY

Solar activity was very low on 12th, low on 13th and 16th, and moderate 14th-15th and 17th-18th August. An M3 flare was observed on 14th, and 1 M1 flare on 15th, and 17th, and 2 M1 flares on 18th August. A short wave fadeout was observed in association with the M1 flare on 17th, and again with the first flare on 18th.

The geomagnetic field at Learmonth (WA) was mostly quiet to unsettled, except for 13th-14th when the field was unsettled to active. There was a minor storm 0400-0700 UT on 13th.

Ionospheric F2 critical frequencies at Sydney were near predicted monthly values except for 15th August when values were about 15 per cent below predicted monthly values. Spread F was observed on 12th, 13th and 15th August, with Sporadic E also observed on 12th.

FORECAST FOR THE NEXT WEEK (19 - 25 August)

SOLAR: Low
GEOMAGNETIC: Mostly quiet to unsettled, with active levels expected on 24 August
IONOSPHERIC: Near predicted monthly values.

Courtesy of IPS Radio and Space Services, Sydney

Summary by Pat VK2JPA ANARTS Broadcast Officer

Blue Mountains Amateur Radio Club News

We invite one and all to the next meeting. The highlight of the evening will be a guest speaker Mr. Webb who was a radio operator in the Merchant Navy during World War II. Looking forward to some old radio stories from a bygone era, so please come and join us.

The meeting commences at 8pm, the 2nd of September, the venue is the Springwood High School corner of Grose Road and Chapman Parade Faulconbridge, you should enter from Chapman Parade. During the evening refreshments will be served, all are most welcome.

from Alex VK2KAS Publicity Officer

Summerland Amateur Radio Club

(1) Last weekend some members provided communications for a Horse Endurance Ride, in the Toonumbar Dam area, way beyond Kyogle. An overnight camp was involved, with a flat tyre and a horse stampede, in the middle of the night, helping to keep them on the ball.

The ride started before daylight and finished, successfully, around 2.30pm.

VHF proved quite adequate for the purpose, in spite of the hilly terrain. A few valuable lessons were learnt and it 'all came together in the end'.

(2) Amateur Radio Exams, conducted at our clubrooms last Sunday, gained us a new limited call, two upgrades to full call and two near misses! Congratulations and commiserations.

(3) The next social outing for members, and friends, will be a family B.B.Q. cum Sausage Sizzle, at the clubrooms, on Sunday 28th August. Come along, all welcome, and have an 'eyeball' over a sausage or two.

VK2GJ, Graeme, Publicity Officer

: C. C. (Clay) Wynn, N4AOX

Right! I can appreciate why someone might not feel confident or well enough equipped to try to fault find in a current "contester rig", but this is a simple soldering job, no fault finding or set-up needed. Perhaps those shops filled with radios for diode swaps are evidence of the progressive de-skilling of amateur radio? Or could it just be a case of people now being more prepared to throw money at problems ?

It seems to me that folk used to be a lot more prepared to "Have a go". I'll be pleased if we've left poverty behind, but I do hope that we haven't left curiosity or skill behind.

There's a free market in RF semiconductors, and several sources of PINs around the world. Seeking alternative parts is a long established amateur tradition. There is some effort involved in finding a potential part and in trying it out, but this can often give the seeker knowledge and experience worth more than the savings on parts. Long period PIN diodes are not really mainstream components, so price and availability won't be wonderful, no matter who made them. There may be some parts available from surplus dealers that could still be better than the standard parts built into the radios.

That reply cheered me a little, maybe I'm pessimistic about the scale of reading of technical atricles ?

Cheers,
David GM4ZNX

>Ok this might be a really dumb question - but I am going to ask it anyway.
>
>If one needed to download truly large files from the Internet (say in the
>range of 100 files of 50 megs each every day) - then the first thing that
>jumps to mind is - direct connect and bring in a T1 trunk from the *phone
>company* and lease it for about $900 per month - right?
>
>Is this actually the most economical way to do it? Couldn't an enterprising
>network provider who is already hooked up to the net just interface with a
>radio transmitter that could put data on the air waves and allow anyone with a
>receiver/modem to pick it up for the cost of the equipment and the cost
>to the network provider? Hey I told you it was a dumb question before
>you started reading!

It's technically feasible. The questions that have to be answered
though are who pays, how much, and on whose spectrum? Businesses
aren't going to provide this service for just the cost of the
equipment, they want to make a profit on this value added service.

Liveline produces a weather product for TV broadcasters. They
distribute the product this way. You call them on landline with
a list of desired weather product (maps), and they queue that
up on their broadcast server and send it digitally encoded via
geosync satellite transponder. The product you order is coded
to activate your decoding box, and is downloaded into your
forecast computers. They charge for the map data, and that
has the cost of transmission rolled into it. Somebody has to
pay the geosync satellite operator for transponder time, somebody
has to amortize, maintain, and operate the uplink station, and all
those somebodies want to make a living at it.

Broadcasters are looking into the broadcast server business.
With the coming digital HDTV broadcasts, there is going to
be excess capacity in the data stream. There are several
proposals for selling this excess capacity for broadcast data
services. And of course there are already stock quote services
(and paging) broadcast (encrypted) on subcarriers of FM broadcast
stations. The user pays a fee that covers the data, and the
transmission.

No one is going to do it for just cost of equipment any more
than the telcos are going to give you a T1 just for cost of
equipment. The telco's copper is already a sunk cost. It costs
them no more to give you dialtone than it does to carry a live

call, but they still charge you per minute. That's because they want to turn a buck off you. It's the same for broadcast servers, they want to turn a buck off you. They don't have the copper cost of the telcos, but they have other costs, such as the typical $12,000 a month electric bill for their transmitter.

Then there's the question of available spectrum. There's only a limited amount of spectrum space, and there are lots of different demands for it's use. For a broadcast service to be economical, it has to reach enough customers with product they want in order to spread the costs enough to be competitive with switched point to point telco service.

For regular broadcasters, the magic number is 2.5 cents per viewer per minute, or about $1080 per viewer per month. That's higher than a leased T1 monthly charge (but of course it includes product cost as well as transmission cost). With the much lower number of people consuming a data product being broadcast, the price point is likely considerably higher for a dedicated broadcast data server. If that cost can be made *incremental* to the existing broadcast, it is likely to be small enough to be competitive with switched services.

2980. FT530 Programming Guide

Newsgroup: rec.radio.amateur.misc
Date: 1994-08-22 13:07:16 UTC
From: pas@jupiter.ic.cmc.ca
Message-ID: <1994Aug22.130716.17147@venus.cmc.ca>
Source record: 261237

Folks: I've made a few updates to this document and am
posting it again. I hope some find it useful (I do!).

Peter

O Peter A. Stokes _____________ Voice & Voice mail: (613) 545-2923
<^- Engineering Applications Support __________ FAX: (613) 548-8104
\/\ Canadian Microelectronics Corporation ______ Net: stokes@cmc.ca
\ Kingston, Ontario, CANADA _____________ Radio: VE3ZXT @ VE3CDY
"Don't believe any advice you read"

How VE3ZXT programs his Yaesu FT530 HT

(These instructions are intended to help remind me on how I
program my FT530 and are not a substitute for reading the
manual!)

HINTS:

0. To turn the radio on, push and hold (for 1/2 a
second) the orange button on the left side.
Repeat this to turn it off.

1. If you get into a strange mode or display, hit PTT
as this usually clears it. The radio may display
"ERR" for a moment.

2. To switch from band to band (left to right and back),
use the "BAND" button.

3. If you want the backlight to stay on while using the
radio, enter FM -> LAMP. The LAMP button is just
below the PTT button. Having the light on can make
programming quite a bit easier.

4. The radio is capable of any combination of scanning,
searching or being idle on both bands. For example,
one can be scanning on the left side and carrying on a
QSO on the right side. To make the radio scan, place
the radio on any channel (push MR until the channel
indicator does not have multiple small arrows) and
then push and hold either arrow button. It is also
possible to make the radio alternate scan (scan on the
left, then right, then left, ...). The radio is also
capable of receiving any mixture of VHF and UHF on
either side. If the PLL is unable to lock, the
frequency display will flash.

5. Push the Monitor (Burst) button (above PTT) to break squelch momentarily. Push and hold the same when the radio is off to see the seconds display on the clock.

6. Whenever you make a change to the programming of a channel (frequency, offset frequency, offset direction, CTCSS frequency, Tone squelch enable, Tone encode enable, mode AM or FM), it is necessary to save that channel again to save the changes. As in normal programming, push and hold FM for two seconds, then hit FM again. That will store the current settings in the current channel.

PROGRAMMING GUIDE:

0. Ensure the radio has suitable power and the lithium battery installed.

1. Reset the radio by holding the MR and VFO buttons as you power up the radio. This will clear all settings, time, channels, etc.

2. Enable the extended receive and transmit modifications by holding both arrow keys while powering up the radio again. Note: extended Rx and Tx also require a hardware modification not discussed here. This mod reportedly allows for reception of 110-180, 300-500, 800-950 MHz and transmission of 140-150, 430-450 MHz although I haven't tried these to confirm the extents.

3. Set the clock: FM -> REV to see the clock
FM to go into set mode
(then see page 51 of the manual)

Hint: set the radio in UTC to avoid time zone and time change hassles.

4. Enable ARS (Automatic Repeater Shift) on both bands. This will automatically set the repeater offset to the correct frequency count and direction +/- when you program in a frequency. The radio understands the basic amateur bandplan and will not set an offset if you enter a simplex frequency (e.g 146.520).

FM -> 0 -> 6 -> FM -> 6

and again for the other band

FM -> 0 -> 6 -> FM -> 6

5. Set the alternate display (when only working one band) to display battery voltage (a nice feature IMHO!):

FM -> 0 -> FM -> BAND

and again

FM -> 0 -> FM -> BAND

Alternative display options include blank (---) and clock.

6. Set transmitter default power to high:

FM -> 3

7. Set scan resume mode on both bands to "P" for pause (as opposed to "5" which causes the radio to continue scanning after pausing five seconds on one signal):

FM -> 7 -> FM -> 7

and again for the other band

FM -> 7 -> FM -> 7

8. Set automatic power off if desired:

FM -> 0 -> 3 -> 3

This feature can be useful if you want to conserve battery power or a pain if you are using the radio as a scanner or for monitoring packet. Regardless of configuration, the radio will shut itself off when battery voltage reaches near 5.5 volts, eliminating the possibility of over-discharging the nicads. As the radio nears this shutdown condition, the display will alternate between normal functions and a battery voltage display.

When automatic power off is enabled and the radio is about to shut itself off, it will play a warning medley one minute before shutdown. The default medley is a cute musical passage I detest. Fortunately, one can change this warning song. Refer to page 53 of the manual on how to enable a custom tone sequence and page 46 on how to program it in (it is the tone sequence in autodial memory number 1).

9. Set ABS to the desired ratio. ABS is the Automatic Battery Saver and causes the radio to go into a low-power consumption sleep mode if it is not used for a few seconds. In this mode, the radio remains inactive (conserving power) except for periodic 30 millisecond samples of the frequency being monitored. ABS may cause you to miss the first split second of a transmission and can cause problems for the same reason when the radio is being used for packet. Otherwise, it is a good tool. If I had the money, my car would have ABS too (but that is a different kind :-) To set ABS, enter:

FM -> 4

and then one of the following keys

1 for 10ms sleep, 30ms sample duty cycle
2 for 20ms sleep, 30ms sample duty cycle
3 for 40ms sleep, 30ms sample duty cycle
4 for 80ms sleep, 30ms sample duty cycle
5 for 160ms sleep, 30ms sample duty cycle
6 for 320ms sleep, 30ms sample duty cycle
7 for 640ms sleep, 30ms sample duty cycle
8 for 1.28s sleep, 30ms sample duty cycle
9 for automatic ratio based on recent usage
0 for ABS off

10. If desired, enable Tx Save feature. This feature will adjust transmitted power based on the signal strength of the incoming reception. As a rule, amateurs should always be using the minimum power necessary to maintain their QSO. This is a lazy approach. To enable Tx Save:

FM -> 0 -> 4

and repeat for the other band

FM -> 0 -> 4

11. Program in your favorite frequencies in all the channels. There are 41 per band: 38 channels plus one CALL channel plus one U (upper channel) plus one L (lower channel). If you have enabled the extended receive and transmit, you will find that a wide range of UHF and VHF frequencies can be intermixed on each side. It is also possible to enter 0.8 GHz frequencies in the UHF side! If the frequency display is flashing, the PLL has unlocked and the radio is unable to tune that frequency.

The basic sequence to enter a frequency in a channel is:

VFO enter into either VFO on the band desired

146940 to enter 146.940 MHz

FM (hold for two seconds)

(use arrow keys or dial to select channel to store frequency in)

FM

The frequency is now stored. After a second or two, the radio mode returns

to the VFO. Repeat this process as
necessary to enter all frequencies.

Refer to the manual on the programming of the CALL, L
and U channels. These are used for a quick recall of
the CALL frequency, Lower limit and Upper limit when
searching, respectively. Note that if a CTCSS tone
is stored in a U or L channel, that tone will be used
for decoding during search mode if searching is
initiated from that channel.

To set a CTCSS decode frequency on a given channel:

set radio on that channel

FM -> 2

turn dial to desired PL tone

2

It is then necessary to enable tone decode on that
frequency. To do this, repeat FM -> 1 until TSQ
appears in the display (which indicates Tone Squelch
is enabled).

Refer to the manual on setting a decode frequency or
scanning for a decode frequency.

Don't forget to save any channel options into memory
before moving on to some other programming function.
In other words, if you enable tone decode on a given
channel, you must save that channel again to the memory
location in order to save the tone decode setting.
Otherwise, the minute you move off that channel, the
tone decode setting is forgotten.

To set a CALL channel frequency:

VFO enter into either VFO on the
band desired

set frequency, offset and CTCSS tone

FM (hold for two seconds)

CALL

The radio is capable of receiving in AM mode and has
extended receive capability down into the aircraft
band. Although not discussed in the manual, the
radio can store the mode (AM or FM) in each channel.
To store a frequency in AM mode:

VFO enter into either VFO on the
band desired

set frequency

FM -> 0 -> FM -> VFO (enables AM mode)

FM (hold for two seconds)

use arrows or dial to select channel

FM

Note: the VFO will remain in AM mode until you enter the sequence again (FM -> 0 -> FM -> VFO) or the radio is made to listen to an FM channel. Remember to return the VFO to FM mode after setting an AM station otherwise you may end up programming all remaining channels in AM mode (annoying!).

Important: If you enter any frequency other than an amateur radio frequency, make sure you manually set the offset to - or + so that if you are listening to the frequency and accidentally PTT, you will not transmit on that frequency (e.g. a police frequency!).

12. Set IBS (Intelligent Band Select) if desired. This makes the radio automatically switch to the side, when you PTT, that last had a transmission. To set:

FM -> 0 -> BAND

Note: both bands must be displayed to set IBS.

13. Set DTMF keypad transmit hang time to on:

FM -> 0 -> FM -> 1

This makes it possible to enter a DTMF number sequence (e.g. a phone number during an autopatch operation) without having to hold PTT beyond entering the first digit.

Please send suggestions/corrections to me,

Many many years ago before anyone could afford a dishwasher (or maybe before they were invented) we used to take the old nasty cab radios we were trying to modify to the car wash and CAREFULLY spray them out with the high pressure hot water hose. We would only use the soap spray on the pieces of the cases that did not contain components.

Gary is not quite accurate about CQ buying Ham Radio magazine to temporarily boost their circulation by adding the HR subscribers - I had a lifetime subscription to Ham Radio and received NO additional issues of CQ - the publisher told me I should have purchased the lifetime subscription to CQ (this at the Atlanta hamfest a few years back).

|> Gary

Gary: you dodged the question! Park the political correctness and stay technical! Your insight is good; I have several printouts at home that are your posts (lightning protection and SWR arguments). There is nothing wrong with _talking_ about scanning cellular phone calls. And plus, it is entirely legal.

In Canada.

To answer the reader's question: scanners are able to receive an incredibly large number of transmissions: marine, aircraft, public safety, search and rescue, fire, taxi, security, Mick Jagger's wireless microphone, amatuer radio, satelites, ambulance, public weather stations, military operations, air shows, cordless phones, drug busters and the list goes on. As services go digital over the next couple of decades, today's scanners will slowly become less versatile. Don't hold your breath though... these things take a lot of time.

Source record: 261243

Derek,
Interesting that you brought this up. I happened to be wondering
the same thing...so I took an informal poll at a VEC testing
session this past weekend. Of the folks I talked to, everyone
that used only computer generated CW said that they had trouble
for the first couple of QSOs after passing their 5 or 13 wpm
code tests. One guy claimed that he could copy 25 wpm solid with
computer generated code, but, on the air could only copy about
15wpm or so. So at least from the small population that I talked
to it seems that your observation is correct.
cheers - Warren

I dunno for sure, Derek, but my guess is that very few people actually use it on the air. They learn it to pass the tests (which are sent in perfectly formed, non-QRM'ed fashion) and then don't use it. There are exceptions, of course.

No flames, please...just making an observation with no value judgements attached.

2990. IC-970H use for AMSATS

Newsgroup: rec.radio.amateur.misc
Date: 1994-08-22 15:24:00 UTC
From: JEYESAF@f2groups.fsd.jhuapl.EDU
Message-ID: <2E58C401@fsdsmtpgw.fsd.jhuapl.edu>
Source record: 261236

Is anyone using the IC-970 for 9600 baud AMSAT work, and if so, what modifications are required?

I contacted ICOM customer service and got the following reply:

>Sir,
>
>The IC-970 was developed before 9600 baud packet was on the market.
>Therefore the radio was not designed with the capability of operation with
>9600 baud packet. The IC-970 will work on the AMSAT but not on PACSAT, due
>to the switching speed needed to operate 9600 baud packet.
>
>We do not have factory authorized modifications for the radio outside of the
>original design of the Radio.
>
>73's Ray, KB5KCL
>

It seems hard for me to believe that radio manufacturers are ignoring 9600 baud compatability as much as they are ... the reviews I have read on the new IC-820 also say that it is also not 9600 baud SAT compatible.

I guess I need to start considering other units for my next purchase ...

any recommendations from other users ???

Thanks

No flames, but please... most vet. cw operators will QRS for new operators transitioning into real air time. If you are in range, check in on 40 M CW novice band. I work lots of Novice stations there and also new Generals at 5,10,15 etc. whatever speed they want to work, mostly during weekends but also some week day afternoons and evenings. CW ops that will not QRS for new operators, and there are some, are like some of the self-important clowns on Usenet, not worth talking to anyhow. Most ops will QRS, particularly if you send (at your speed) "PSE RPT ES QRS BK". Still too fast? Send it again. Oh, and there is plenty of QRM, fading, etc. there so you get the full effect.

>the real world?

Yes, it's a bit of a jump to real radio signals, but nothing too bad. The advantages of a code program are significant: practice when you have the time, anywhere, by making tapes; set the speed to just over what you can copy, to get your speed up; copy (pseudo-) random words, letters, etc.; let the computer test your speed; take a mock 13 WPM test to see if you're ready.

Copying strictly over-the-air QSOs gets you good at copying over-the-air QSOs, which might make it hard on you if the VE decides to test you with plain text out of a magazine or some such... Fortunately, most don't.

Robin,
I live in Brussels and make all my purchases for ham gear in the US, because it is just cheaper.
Let me show you:
I bought a TS450S for $1080 at HRO. This is about UKP 720. With 4.9% import duty to the EU and another 19% VAT, it comes to about UKP 897. With shipping another UKP 50 on top. The price of the TS450S in the UK is UKP 1300. See the difference!
I use a TS50S which is a great radio for those 'pick the mike and speak' types show arent concerned with bells and whistles. If you are the 450s or the 850s would be fine.

> two year cellular service contracts. Those analog phones have become
> almost disposable, with less worry about losing or breaking them. Not
> so, with the digital ones.

Actually that is not what has happened here in UK. Digital Cellular phones have become the low cost variety ! Some are marketed at consumers.
I have a "One2One" phone .. for $25 per month I get free calls throughout to anywhere in the London or adjoining areas from 7.)) pm to 7;00 am and all weekend. Day rates are about 45 cents/minute. There are competing digital services and they are grwoing fast. Clearer speech/digital messages etc. The old analogue providers are having to introduce ditial serives to compete.

Oh yes ... they just sound like a buzzing noise on a scanner, my frequency counter won't read ther frequency even though it is in range (1.8 GHz).

2998. 2 meter Repeaters in Europe

Newsgroup: rec.radio.amateur.misc
Date: 1994-08-22 17:30:00 UTC
From: pve@dg13.cec.BE
Message-ID: <2E5864AD@smtp>
Source record: 261326

All,
there is a standard 2meter repeater frequency allocation in use just about everywhere in Europe, with some exceptions.
As we only have 144 to 146MHz available, the repeater band starts at 145.600 to 145.800. It is separated every 12.5KHz. So that R0 is 145.600, R1 is 145.625 etc restarting at R8 with 145.612.5, R9 with 145.637.5 etc. Shift is always -600KHz.
Some places need a 1750Hz tone to open a repeater others dont. Ireland, Greece (needs a PL of 88.5Hz instead), some Netherlands, some France, some Italy dont. The rest do.
So on your next trip just put the frequencies above in your HT and enjoy 2 meter DXing. Simplex frequencies in use include 144.725 (most US military radio clubs, our) and 145.500.

I too mourn the demise of HR and can confirm Gary's suspicion to the extent that this former HR subscriber did not renew his subscription to CQ. I have often wished for a compilation in book form of W1JR's VHF/UHF World columns from HR, Even though I have all the issues, I would gladly buy a book just to have all of them in one easily accessible place. I don't suppose anybody knows of such a publication?

: I called our US Information Agency office here in Honolulu a few years
: ago and asked them to send me the VOA's bcst schedule; they said `No -
: the VOA bcsts are not meant for domestic reception.' Only after I
: explained that I was going to Viet Nam did they say `In that case,
: then we CAN send you the schedule.' They explained their bcsts are
: meant for both foreign listeners and overseas Americans.

Very strange! Before I started getting VOA skeds off Internet, I used to send to VOA Frequency Management for schedules, and I never had any problem getting them. As I recall, frequency schedules and the engineering database schedule were never a problem, and I was also able to get English schedules. However, the "Voices" program guide, various other VOA publications, and the various VOA goodies like stickers, keychains and such were off limits due to the Charter, since I am an American living in the U.S.A. Of course, what the USIA office in Honolulu does and what VOA headquarters does may be two different matters altogether. Anyway, Dan Ferguson is kind enough to post schedules on this newsgroup, and that's a big help for a lot of us, I'm sure!

I would be very hesitant to put any electronic equipment in a dishwasher. Don't forget that it is assembled with lead solder. I imagine that you will end up with measurable amounts of lead on your next load of dishes.

Anyone seen a 'cheat-sheet' for the Kenwood TM-733A? Just purchased one last week and find that you have to read the whole manual. Hate to have to carry the manual in the car to make changes on the fly. Unlike Yaesu Kenwood does not provide a quick reference cheat-sheet.

Noticed a neat FT-530 Programming Guide by Peter A. Stokes, ve3zxt. Looking for something like that for the TM-733.

Thanks

Dick Kriss, KD5VU

Message-ID: <1994Aug22.194952.7013@newsgate.sps.mot.com>
Source record: 261261

I'm not sure what VOA has to do with ham radio, but since the thread's been started...

I caught the tail end of a segment on NPR last week about the VOA being on internet and that the audio from their newscasts is available. The commentator was playing some of the files. The VOA guy she was interviewing (don't remember the name but he's a honcho in their network services) said he couldn't give any info on how to access or play the files since they were intended only for use outside the U.S. (seems kinda silly to me but that's probably their charter, no more, no less). It didn't stop the NPR person, she just went ahead and connected and played some of them. Then I remembered reading something here on the net about the service but couldn't remember when or in what group. Unfortunately I missed the first part of the segment and didn't hear the address of the VOA server or what was being used to connect to it. I thought I'd give it a try too, if I could. Anybody have any more info about it?

3008. FT530 breaks squelch when it shouldn't

Newsgroup: rec.radio.amateur.misc
Date: 1994-08-22 19:50:32 UTC
From: pas@jupiter.ic.cmc.ca
Message-ID: <1994Aug22.195032.21804@venus.cmc.ca>
Source record: 261263

Hello,

A friend of mine bought a Yaseu FT530 handheld and it seems
to behave differently than mine. In his, the squelch
seems to open momentarily when the radio pauses on a
channel while scanning. This channel is set to tone
squelch decode at a tone of 107.2 Hz. Most of the time it
has a data transmission and on occasion, voice with the PL
tone added. The voice is what he is interested in
hearing. The result is an annoying data noise burst from
the radio. The behavior is irregular (it doesn't do this
every time it scans the channel). My radio does not do
this.

My question: is this, by chance a known problem with the
FT530? Sending it back is a last resort...

73,
Peter

DAILY SUMMARY OF SOLAR GEOPHYSICAL ACTIVITY

21 AUGUST, 1994

/\

(Based In-Part On SESC Observational Data)

SOLAR AND GEOPHYSICAL ACTIVITY INDICES FOR 21 AUGUST, 1994

NOTE: Energetic electron fluence has fallen to near-normal levels. Also,
please note that GOES-6 X-RAY SENSOR DATA IS NO LONGER AVAILABLE. In
the future, the new GOES-8 spacecraft may become the new secondary
spacecraft for the solar x-ray data. GOES-7 will likely remain the
primary spacecraft.

The 3-Hr Ap Indices for 20 AUG 94 are: 5 12 13 7 6 7 8 6
Greater than 2 MeV Electron Fluence for 21 AUG is: 1.0E+07

SYNOPSIS OF ACTIVITY

Solar activity was low by virtue of a single, uncorrelated
C1 xray burst at 21/0512UT. No other activity was noted over
the past 24 hours.

Solar activity forecast: solar activity is expected to be
very low to low for the entire forecast period.

The geomagnetic field has been at quiet levels for
the past 24 hours. High latitude stations experienced
a short period of minor to major storm levels from 21/1500
to 21/1800 UT. The reason for this activity was not immediately
apparent.

Geophysical activity forecast: the geomagnetic field is
expected to be quiet to unsettled for the three day forecast
period. High latitude stations may see continued periods of
minor to major storming for the entire forecast period.

Event probabilities 22 aug-24 aug

Class M 01/01/01
Class X 01/01/01
Proton 01/01/01
PCAF Green

Geomagnetic activity probabilities 22 aug-24 aug

A. Middle Latitudes
Active 05/15/30
Minor Storm 05/10/15
Major-Severe Storm 01/01/05

B. High Latitudes
Active 20/30/30
Minor Storm 10/15/15
Major-Severe Storm 05/05/05

HF propagation conditions were near-normal over all
regions. The decay and departure of Region 7765 beyond the
west limb today has decreased the 10.7 cm solar flux to low
values. The weak level of ionizing radiation influencing the
ionosphere will result in decreasing MUFs over the next week,
particularly over the polar and auroral regions.

------ ---- ---- ---- ---- -- ------ ------ ---
NO EVENTS OBSERVED.

NOTES:
All times are in Universal Time (UT). Characters preceding begin, max,
and end times are defined as: B = Before, U = Uncertain, A = After.
All times associated with x-ray flares (ex. flares which produce
associated x-ray bursts) refer to the begin, max, and end times of the
x-rays. Flares which are not associated with x-ray signatures use the
optical observations to determine the begin, max, and end times.

Acronyms used to identify sweeps and optical phenomena include:

II = Type II Sweep Frequency Event
III = Type III Sweep
IV = Type IV Sweep
V = Type V Sweep
Continuum = Continuum Radio Event
Loop = Loop Prominence System,
Spray = Limb Spray,
Surge = Bright Limb Surge,
EPL = Eruptive Prominence on the Limb.

>It only puts out 10 Watts but a linear will take care of that problem.
>Look around, there are good deals to be had if you know where to look!
>73 and see you on VHF SB.

Now there's a rare rig. I have an Icom 211 also. Very keen green and orange
multi-concentric dial with 2 speed control knob. But mine had all kinds of
bad solder joints on the motherboard that were very difficult to find and fix.
I have a hardly readable blueprint schematic but no location references for
parts. Icom is no help. I've fixed most problems and it works okay but
probably needs alignment of the approximately 100 pots, coils, and caps.
I was told that I have one of only two IC-211's sold in the NorthWest.
I can't find any ads for it in my collection of Early 70's magazines.
Oh, I beat you on price. I paid $35 for mine.

3012. EOSS-18 Balloon Flight Postponed

Newsgroup: rec.radio.amateur.misc
Date: 1994-08-22 20:12:58 UTC
From: rickvg@usa.net
Message-ID: <ARGMkSEHGEQU069yn@usa.net>
Source record: 261208

FLIGHT SCRUBBED

The flight of EOSS 18 was scrubbed due to unfavorable upper
level winds that would have taken the flight over a heavily
populated area.

FLIGHT PROFILE FOR EOSS-18

LAUNCH DATE : August 27,1994

LAUNCH TIME : 16:00 UTC

LAUNCH SITE: NAVSYS Corp.
Monument, Colorado, USA
Take the Baptist Rd. exit from I-25, go west to
WoodCarver Rd. (the first left) then south to
NAVSYS Corp.

LAUNCH SITE COORDINATES: latitude 39.09165 deg North
longitude 104.87129 deg West

FLIGHT EXPERIMENT: Flight Qualification of the payload stabilization
system. Otherwise known as the "despin device"

EXPERIMENT CONDUCTED BY: Larry Cerney/N0STZ

PROJECT INTEGRATOR: Larry Cerney/N0STZ

FREQUENCIES:

Shuttle II:

Telemetry 144.340 MHz (AX.25 Packet - Plain Text)

ATV 426.250 MHz

Tracking Beacon: 147.555 MHz (CW FM)

HF Net: 7230 kHz LSB + or - QRM

Tracking and Recovery Team: 146.970 MHz Repeater (courtesy Pikes Peak FM
Association)

PURPOSE OF THE FLIGHT:

The purpose of the flight of EOSS 18 will be to test the stabilization
system that was built from scratch by Larry Cerney/N0STZ. Larry has
been diligently developing this system for the past several months.

Since the early days of EOSS, we have searched for ways to slow the rapidly spinning payload as it ascends and descends through the atmosphere. Larry has come up with stabilization system that will offer us better ATV video and also help alleviate some of the stresses that have been put on other components of the balloon payload train. If you were in attendance at the ground station during the flight of EOSS 17 you may have seen the mock-up of Larry's system.

APRS position strings are included in telemetry on all flights with LORAN or GPS onblard. So, if you are in the area (Colorado and surrounding states), fire up APRS and follow the flight on your computer.

APRS is available from oak.oakland.edu in one of the hamradio subdirectories.

>AL N1AL

Al,
In the "old days" for which you pine, the Tech wasn't an entry-level license, most hams weren't doing packet, FSTV or facsimile. Dr. Debakey hadn't done the first heart transplant and we were smack dab in the midst of a cold war with a rival superpower. Nobody had computers in their homes, so there wasn't fidonet, usenet or internet. Gallstones had to be removed with surgery (instead of ultrasonics), the use of lasers in surgery was unheard of and there were a lot of things we have now which improve our quality of life which didn't exist back then.
The no-code license wasn't available when I got my license either. It is now. Welcome the newcomers, otherwise there won't be a hobby to pass on when you assume "room temperature."

John, N4XAN (adv. class - learned 13 wpm for the license in 1990, haven't used it 3 times since)

3015. Re: Iambic Keyer Standards

Newsgroup: rec.radio.amateur.misc
Date: 1994-08-22 21:06:20 UTC
From: tconboy@uswnvg.com
Message-ID: <33674@uswnvg.uswnvg.com>
Source record: 261267

David George (al434@FreeNet.Carleton.CA) wrote:

: I understand there are two standards for Iambic Keyers. Could
: someone please explain them to me.

The difference is when the dot or dash memories load. Curtis calls them
the A and B modes. Which is which escapes me. One loads the opposite
memory, in essense, when the key lever is first pressed, but only then.
The second mode typically loads the opposite memory when the current
code element starts, if the opposite key contact is still closed.

I find the second mode very hard to use in full iambic mode. Let me
give you an example:

You want to send a letter "K". This is a nice character to send with
the Iambic mode. You squeeze the key levers together, but hit the dash
lever just a little sooner than the dot lever. The dash starts, is
followed by a dot, and then is followed by the final dash. As soon as
the final dash starts, I let go of both levers. Character finishes...
at least with the first mode. With the second mode, the dot memory is
reloaded as soon as the final dash starts and you wind up with a
trailing dot, making it a "C". To avoid this, you have to let go of the
dot lever prior to the start of the final dash. This is hard in
practice at high speed (at least for me). I've even seen some designs
that require you to open the dot contact before the end of the dot!

I suspect that most users of keyers that generate the trailing dots do
not normally employ the iambic ("squeeze key") function, but actually close
only one key contact at a time (bug style). In fact, I can use the
keyer in my IC765 if I use an old single lever paddle, but my hand gets
tired much sooner, and my code not quite as smooth.

I wish my '765 could be set up to eliminate the "trailing dot problem".
(To avoid this, I use an external CMOS keyer that I designed myself).
I see that AEA added the second mode to their Morse Machine in a
firmware upgrade after the initial product release.

>phones going to use the same freq spectrum? (~824-849)

Yep, you're missing something. The SS system called IS-95 will use
a SS modulation of 1.25 MHz. At first, only a single such wide channel
would be used for the CDMA SS system. The analog system would be removed
from those channels. Later on, as the proportion of phones shifts
toward CDMA capabile phones, more bandwidth can be converted to SS
use. Note that CDMA SS allows a single 1.25 MHz bandwidth channel
to be used by ALL cells in the system. This is a key aspect of
CDMA's higher capacity than other techniques

Ouch. Sounds as if you've been audited by the IRS.

I've talked to MANY foreign students on campus about the VOA bcsts and none of them had anything bad to say about the VOA - everyone one of them mentioned how helpful the bcsts were in getting familiar with American culture; some who were from very small towns or villages said their community was completely dependent upon the VOA for world news.

One reason those outside the US might hate Americans is that they've encountered American tourists with `attitude problems'.

Jeff NH6IL

3020. FLAME the FCC

Newsgroup: rec.radio.amateur.misc

From: ek207@cleveland.Freenet.Edu
Message-ID: <33b9mv$7q7@usenet.INS.CWRU.Edu>
Source record: 261270

My son and I took our no code tech exam on MAY 15 this year. My son is 17 years and was all hyped up about the exam. He wanted to pass so badly. Well, he did, he passed both parts with 100%. I did not as well but passed anyway.

Now, 14 weeks later we still do not have our licenses. Vacation passed where we could have used our radios, other times passed, but still no license. A call to the ARRL only confirmed that they sent the results to the FCC. Otherwise they do not do anything for your dues.

What is taking the FCC so long? Anyone else any good ideas to fire up some action from those lazy bastards? But like they say, government workers (an oxymoron) are the lowest of all.

Had to get this of my (mild mannered otherwise) chest.

SUBJ: IPS DAILY SOLAR AND GEOPHYSICAL REPORT
ISSUED AT 22/2330Z AUGUST 1994 BY IPS RADIO AND SPACE SERVICES
FROM THE REGIONAL WARNING CENTRE (RWC), SYDNEY.
SUMMARY FOR 22 AUGUST AND FORECAST FOR 23 AUGUST - 25 AUGUST

1A. SOLAR SUMMARY
Activity: very low

Flares: none.

Observed 10.7 cm flux/Equivalent Sunspot Number : 71/6

GOES satellite data for 21 Aug
Daily Proton Fluence >1 MeV: 5.4E+05
Daily Proton Fluence >10 MeV: 1.3E+04
Daily Electron Fluence >2 MeV: 1.0E+07
X-ray background: A2.0
Fluence (flux accumulation over 24hrs)/ cm2-ster-day.

1B. SOLAR FORECAST
23 Aug 24 Aug 25 Aug
Activity Very low Very low Very low
Fadeouts None expected None expected None expected

Forecast 10.7 cm flux/Equivalent Sunspot Number for 23 Aug: 70/5

2A. MAGNETIC SUMMARY
Geomagnetic field at Learmonth: quiet to unsettled

Estimated Indices : A K Observed A Index 21 Aug
Learmonth 7 2122 2223
Fredericksburg 7 8
Planetary 7 8

Observed Kp for 21 Aug: 3211 3321
2B. MAGNETIC FORECAST
DATE Ap CONDITIONS
23 Aug 10 Quiet to unsettled
24 Aug 15 Unsettled to active
25 Aug 10 Quiet to unsettled
COMMENT: Brief active periods are possible on 23-25 Aug.

3A. GLOBAL HF PROPAGATION SUMMARY
LATITUDE BAND
DATE LOW MIDDLE HIGH

22 Aug normal normal normal
PCA Event : None.

3B. GLOBAL HF PROPAGATION FORECAST
LATITUDE BAND
DATE LOW MIDDLE HIGH
23 Aug normal normal normal
24 Aug normal normal normal-fair
25 Aug normal normal normal-fair

4A. AUSTRALIAN REGION IONOSPHERIC SUMMARY
Observed
DATE T-index MUFs at Sydney
22 Aug 22 near predicted monthly values

Predicted Monthly T-index for August: 20

3023. The VOA discussion

Newsgroup: rec.radio.amateur.misc
Date: 1994-08-23 00:12:00 UTC
From: pve@dg13.cec.BE
Message-ID: <2E58C2DA@smtp>
Source record: 261247

As someone working and living in Brussels, Belgium, I sometimes listen to the VOA.

VOA comes strong on various frequencies as well as on satellite.

VOA news programs are US inclined, with frequent 'the following broadcast represents the views of the US government' prefaces to various programs.

VOA output is aimed at areas that may seem to be under, or about to be, under US influence. There is more output to Africa than to Europe for example. The fact that VOA may be seen as propaganda, may make its output to the US population immaterial. No point in providing information to people that already know it.

Apart from its political theme, VOA has superb science programs as well as great Jazz music programs.

Thats for radio,

VOA TV, or rather Worldnet as the TV service is called, also appears here. It can be picked up before the German Deutsche Welle Broadcast in Europe on Eutelsat Satellite and mainly carries McNeil Lehrer, Computer Chronicles and other PBS programs that are great. In addition, C band services are also available with additional material.
Finally, there is VOA Europe, a specialized service for Europe in FM stereo via satellite.

And for your information, as far as general programming is concerned, World Radio Network Inc, uses one of the MTV sound subcarriers on Europe's most popular satellite to carry broadcasts from various world broadcasters including NPR, Radio Australia, Radio Japan, Radio Sweden, Ireland, Radio Vienna, Radio Netherlands and more, rotated on a 24 hour basis. With great audio fidelity, and a cost of $200 for a complete satellite reception system, it may even beat a SW set.

Best,
Peter Vekinis, KC1QF/ON9CGV/EI4GV, Brussels

> one of the amplifed speakers?

I have a 20 year old Rat Shack 10 watt PA amplifier that I use. I run a
cord from the audio of my DJ-580T to the amp. I also use a Motorola
speaker. I can blast anyone out of the vehicle.

I installed a Rat Shack stereo into my XYL's car. The stereo has an external
CD audio jack. Just ran a cord from the audio of her HT to the CD jack and
wah-lah...works like a champ.

These are just two ideas out of thousands you could try.

I have uploaded to the SimTel Software Repository (available by anonymous ftp from the primary mirror site OAK.Oakland.Edu and its mirrors):

SimTel/misc/info/
pcfans.zip Network survey & summaries of keeping PCs cool

PCFANS.ZIP is an 85+ response survey about PC fan designs and success or failure at keeping one's PC cool. Respondent messages and two summaries (one technical and one highlighting network ops) are included. All solicitations and collection were done over the Amateur packet radio network and the study gives an interesting numerical analysis of network response time.

Most of the hams that I test never use the code on the air. They learn it on
the computer and never use it on the air. I have heard some of them complain
that it was difficult to switch from the keyboard to a pencil & paper. I would
let anyone test on a computer that wanted too.

I got up to 5 words am minute on the computer and went the rest of the way on
the air. Copying one strong clear signal was easy compaired to 20 meters. I feel
that I could have learned the code faster with a computer but it wouldn't have
been as much fun.

srphillips@ccgate.dp.beckman.com (Steve Phillips) writes:

>Can you 6M U.S. coast to coast?
>If so, how much power and what antenna type is best?

When there are no propagation enhancements going on, you'll have local communications with considerably better coverage than the higher VHF bands. When the band is open due to Sporadic-E propagation, which can happen anytime, you'll cover about half of the US. When the band is open due to F2 propagation, which happens at peaks of the sunspot-cycle, you can cover the world.

My experience has been with relatively low power 6 meter stations with modest antennas. I've run 1 to 50 watts into dipoles, verticals, and three-element yagis, at heights of usually about 20-30 feet. And I've had a ball on six meters! I monitor FM almost all the time (52.525 MHz simplex) and tune the SSB/CW part of the band whenever the mode strikes or I hear longer-than-usual-ranged activity on FM. All else equal, SSB and CW will outperform FM. But once the band opens, anything goes.

*** Stuff Deleted ***

I agree with you 100%. What you got is a law that's unenforceable. Sort of like a law that L.A. County has had for a few months, making it illegal to be on a street corner trying to solicit work (day laborers) in unincorporated areas. The L.A. County DA's office absolutely refuses to even file charges against these day laborers. They just don't have the resources, or even the will, to do it. It's just that the County Board of Supervisors gave in to a rich group of homeowners who claimed the gathering of day laborers lowered their property values.

But here with cell phones, the cell phone industry got these laws passed, claiming it was an invasion of privacy. Then those air-head bureaucrats in Washington agreed, when they suddenly find out that their own cell phones weren't private, as they once thought, so lets make a law. Where have these bone-heads been all their lives? Didn't they realize a cell phone is just a sophisticated two-way radio, and anyone who tuned into the right frequency in the area where one is operating can hear it. Passing laws just won't do a thing about it. There are already millions of scanners and other radio receivers out there that can receive this stuff. Passing a law ain't going to help one bit. I feel absolutely no pitty for the cell phone

industry. If they really wanted a reasonably secure cell phone network, the networks would be 100% digital by now. Instead, they lobby to have laws passed to cover their own mistakes. It's enough to make me throw-up...

> else.

Well, there _might_ be, if someone claimed that your *notes* were just a transcription of the dots and dashes, and that you weren't actually decoding the morse until the question answering part of the test. Why limit yourself to pencil and paper? Why not just _tape_ the test, and then play it back slowly when answering the questions?

> My shorthand copy doesn't *look* like conventional dots and dashes.
> I doubt anyone else could make heads or tails of it. The same could be
> said for some people's handwriting. :-)

I still think that it is too easy to use this reasoning as an excuse to cover not being able to decode morse at the speed the test is meant to examine. And, no matter what certain magazine publishers might recommend, my sense of honor would forbid me to make use of such devices.

As far as I'm concerned, there is a line somewhere between using pencil and paper to form an intermediate storage step in _decoding_ morse, and using it to form an intermediate step in _storing_ the decoded material before answering test questions. On one side, IMHO, is cheating, and on the other is

"shorthand".
How to tell when such a line is crossed, is, the more I think on it, not so easy. Perhaps, if I were King, I'd let people use only a common, previously known form of shorthand for trancribing their test reception, and declare that any _privately_ defined shorthand is not allowed. It wouldn't be the first time that a perfectly good way of doing something was banned because of the existence of those who would use it to cheat, and one could not validly then say that I was denying the benefits of shorthand from those who would choose to employ it: if they want to use shorthand, fine, they can use a recognized form that we know is _not_ designed as a diguised attempt to just transcribe the dots and dashes.
Unfortunately, I'm not King.

> If it's allowed to copy *in your head* in order to answer the exam
> questions, and it is, then there's no reason to forbid a pencil and
> paper aid of whatever form for the same purpose.

Well, I'm trying to show you that, IMHO, there _is_ a reason to do just that. The difference is that few, if any, copy code in their head by memorizing the entire 5 minute exam *in dots and dashes* and then proceed to leisurely decode it during the question period, but there are *plenty* of ways to do this with pencil and paper, and, again, as far as I'm concerned, that is cheating.
So, I think your analogy simply fails.

> The important thing
> you're supposed to show is that you recovered the *content* of the
> text sufficiently well to answer the questions without the aid of
> a machine, IE you're supposed to *emulate* a machine for the purposes
> of the test.

Let me word my opposing viewpoint in your language:
You are supposed to do the machine emulation *during* the 5-minute transmission of the exam, not during the ensuing test to see if your machine emulation was flawed. Do you see what I'm saying now?

Of course, we can simply agree to disagree, but somewhow I feel that my view is more nearly representative of the spirit of the regulation.
And, if you adhere to that honorably, and pass the morse exam, you can justifiably feel like you've accomplished something with pride.
Of course, feeling pride in one's accomplishments is rather old-fashioned these days.

> No one is concerned about the internal intermediate
> steps taken by a machine, so no one should be concerned about the
> intermediate steps you take emulating a machine.

..*During* the time alloted for you to be emulating the machine.

That time ends after the first 5 minutes. I agree that, during that phase, no one should, and no one acutally _does_ care whether you're doing it via cute mnemonic phrases, a sense of rythmn, or by seeing dots and dashes in your head, or whatever.

> All that should
> matter is whether the *content* is output successfully.

Well, that really isn't true, otherwise my repeated example of using a tape recorder to help you in the process *ought* to be allowed.

What actually matters is that we try to test people in a way that satisfies the F.C.C. And I think they would prefer that you demonstrate that you can decode morse at essentially the rate it is sent, not que it up to accomodate a significantly slower decoding speed. Suppose they decide that they are going to reexamine you? (Correct me if I'm wrong, but they _can_ do this, can't they? Particularly if they suspect there was some sort of "funny business" going on when you were examined, right?) Do you think you'd still pass? This is an honest question. Surely there is in the history of the F.C.C. some indication of _their_ opinions in this matter.

I was going to follow this with a soapbox discussion of why I think that Mr. Green's attitude was equivalent to the philosophy that one should disobey even trivial laws that one finds fault with, and how such narrow-minded and ultimately asocial attitudes were behind some of the major problems facing America today, but decided that it wasn't worth it. He's nowhere near as dangerous as the Ollie Norths of the world.

I bet you a dozen doughnuts you end up with measureable amounts of
lead on every load of dishes you do. Lead is detectable down into the
ppt range.

The neutral-to-slightly-alkaline water produced by most dish
detergents shouldn't leach much lead at all from solder, not even the
cruddy 40/60 SnPb stuff. That which does come out will be thoroughly
washed away.

In short, don't lose any sleep. If you are paranoid, one empty-unit
cycle should wash it all away.

Cor, that's a lot of bandwidth. 5 gig/day? T1 gets you 13 gig/day, no
compression. If you could stand 1 gig/day, you could go ISDN; I'm told
here in the south bay ISDN connections are $70 to install and
$28/month. Excluding equipment costs (still not really all that
much--cheaper than a T1 rig) that's pretty hard to beat.

>Is this actually the most economical way to do it? Couldn't an enterprising
>network provider who is already hooked up to the net just interface with a
>radio transmitter that could put data on the air waves and allow anyone with a
>receiver/modem to pick it up for the cost of the equipment and the cost
>to the network provider? Hey I told you it was a dumb question before
>you started reading!

I don't know the rules for that part of the service well enough to
give an authoritative answer, but I bet you'd have problems getting an
appropriate license. Having a "downlink" independent of (any) "uplink"
seems weird to me somehow, but perhaps I'm just used to copper.

I hope someone out there can give a more definitive answer. Part 73 I
know (sorta mostly); the rest is pretty shaky!

Hello fellow amateurs.
A friend of mine, PD0MHS, is compiling a set of documents for a new clubstation being set up in Hungary. There is not much available over there. For that reason, some Dutch amateurs are assisting as much as they can. One of the items requested is the documentation set for the SB-230. This item is rare in Holland, because the SB-230 does not conform norms set by the Dutch equivalent of the FCC, the HDTP.
If anyone has such a doc, and is willing to send a photocopy in the aid of our Hungarian fellows, please mail your intention to me. If more people apply, I will select the shortest surface mail path, en mail the address to wich the docs may be posted.
I thank everybody in advance for the effort of reading this posting, and perhaps for willing to help.

73,
Rob, PA3AXI

Hello everyone:

A common complaint about the newer micro handhelds is the low volume audio. There is a fix to that problem, which I have applied to my Kenwood TH-78A. I use a CD Player-to-Cassette adapter (Radio Shack 12-1951), it plugs into the headphone jack of the HT and the adapter loads like a cassette into the car stereo system. With this setup one hears the HT audio amplified by the car stereo, so there is plenty of power available. Also, it is possible to modify audio tone with the stereo controls.

Greetings,

I am using a TM742E dual-bander from Kenwood for several weeks.
The unit works fine, but I wonder what it's capable of doing rather then the functions which are described in the operating manual.
For example: how can the set be switched on and off in the cross-band repeater mode by using an external handheld with DTMF??
The 742 can be remotely controlled with DTMF, but the commands are quite limited (as documented in the manual).

I already mentioned the out-of-band spurious responses when using the rig outside the 70 cm band in an earlier Email message.
Does anyone already know a fix for this problem?? Most 742's do have the same problem.

73's de Tom PA2TSL

Well, I got the last two years of my 3-year HR subscription as CQ. It was the last time I ever took an extended subscription to anything. I had read CQ a couple of times back in the '50's, and decided it was too puerile for my (then) teen-age sensibilities. I noticed, when I got the two years of subscription from them, that they had improved a bit over the last 35 years, but not enough to justify the price of their subscription.

I suspect Gary is right that the circulation boost would have been temporary, because I couldn't imagine a more incompatible readership than the techies of HR and the contesters of CQ. They gave some lip service about putting technical articles into CQ, but they never did (and I hope you don't call the drivel they do publish, "technical").

: : for the sparkplug changeouts. One of the biggest problems was finding a cheap
: : second source for those @#$%& overpriced HP diodes ;-)

[deletions]

More news coming in a subsequent *QST*, but we have discovered that the lower-cost answer--and one that should provide practically the same IMD reduction at amateur frequencies--is to use *Motorola MPN3700* diodes instead of the HPs.

We will also show that 1N4007 rectifier diodes, although they contain PIN structures that can provide reasonably good IMD performance compared to intended-for-RF-switching PINs like the 3081 and MPN3700 *in forward conduction*, *aren't* a suitable low-cost answer to the 3081 and 3700 because they must be *reverse*-biased to exhibit similar "turned off" IMD dynamic range compared to 3081s and 3700s that simply have forward bias removed.

To answer the begged question ("What do I mean by "lower-cost"?): Allied Electronics carries the HP diodes for (rounded number) $2 each. Newark Electronics carries the Motorola diodes for (rounded) $1 each. (I suppose there are volume discounts; haven't factored that in.)

What's also neat is that the Motorola parts are available both in leaded and surface-mount form--important because so many of our radios are now full of SMDs. The leaded part is MPN3700; the surface mount (SOT-23 package) is MMBV3700. Newark carries both; they list the MMBV3700 as MMBV3700L; dunno what the *L* means.

: QST was borrowed by the ARRL as its logo for the magazine in 1915, starting
: with the first issue, since it was the ham equivalent of a "general
: call to all stations", in print.

Historiographical quibble: ARRL didn't borrow *QST* as its logo for the magazine; because *QST* magazine wasn't bought by ARRL until 1919. *QST* was originally owned and published by ARRL's cofounders, Clarence D. Tuska and Hiram P. Maxim. Why did they and not the entity called ARRL start/own *QST* at first? Because they had just founded ARRL, and ARRL the entity therefore had no money worth mentioning. (Almost at once, by the way, the light came on a bit more brightly and they incorporated as the QST Publishing Co to protect themselves in case the new venture went bankrupt.) In no way did they start *QST* as a money-making venture; it was nip and tuck--largely nip--until they threw in the towel in the face of WW I and the resulting government closedown of Amateur Radio.

Maybe that is why I've had no trouble using 1N4007 rectifier diodes--my
inexpensive biasing technique using 470 ohm resistors does *reverse* bias
those diodes during turn-off. People have commented to me that they tried
them and they didn't work but they work fine for me. :-).

Contact the ARRL directly and they will provide you with information. I beleive they use Albert Wohler Insurance Agency. The same agency has been handling their claims for years. It is an excellent program, and includes insurance on all your equipment - whether lost or stolen, including lightning protection (except antennas).

ARRL phone number is 203-666-1541. Just ask the operator about the ARRL equipment insurance and she'll point you in the right direction.

|> I've been playing around with my satellite program, and I would like to update
|> the elements for all the satellites and for any others I can get my hands on.

Read rec.radio.amateur.space (or is it sci.space?). I, too, just picked up a tracking program over the last couple of weeks, and have been looking there for Keplerian element updates, or keps.

You can also FTP to archive.afit.af.mil, cd to /pub/space, get tle.new, and import that file using the NORAD layout.

I use PCTrak300, which allows a max of 200 satellites, so it maxes out before all satellites are updated. I suggest you completely erase your program's memory of all satellites before importing the new set so you don't waste any database slots on satellites (or STS missions) that may no longer be up.

Or, you can ftp any .tle files and import them as NORAD elements for a subset of tle.new. See the first part of the file name for the description of the types of satellites you will be updating, be it weather.tle or amateur.tle for instance.

You should at least review one .tle file so you know what to look for when they are posted to whichever newsgroup they are posted to between the two I listed at the top.

I have a TNC at home, but only a scanner with it, so I'm working on a Crosstalk script to save keps whenever I'm lucky enough to be monitoring while someone else in my area is reviewing them. I already have one that saves the subject line (and soon to be body) of an article when someone has something I'm interested in for sale.

Hope this helps.. it's sure helped me.

Well, even if technically feasable (AM/FM, etc) to quote president Nixon:
"It would be wrong".

Legal aircraft radios need to be certified for that use.

Of course, if you have two broken legs and have just crawled out of your
1957 Aerocoupe, anything goes.

I've seen that you got some good answers about clubs and financial support, but
let me add another twist.

Our company club sponsers three repeaters all with autopatches. Two of the repeaters
are open. Because we are a company sponsered club we cannot accept members who
are not employed by Racal. In addition since the patches are connected to the
company PBX we cannot, by company decree, open the patches to non-members.

It is always best to ask before trying to access a patch belonging to a group
of which you are not a member. Those who try to access ours are politely informed
of our policy. If they persist the machine is turned off by a control operator.

Does anyone know where/how to get this information ?

For mainland U.S. assignments only:

Spend a few cents to call 717-337-1212 during normal business hours.
Dial into the phone menu 2 then 7 and a call district to get the
assignments for that district (then dial 0 to get back to one of the
menus for another go at another district, if you want). They've
changed the menu options since the last time I called, so the "7" is
subject to change.

District 1 as of 8/1/94: AA1JV, KD1VZ, N1SUN, KB1BJW.

/JBL

P.S. They don't usually update the recording until 10-15 days into
the next month.

>an off the shelf hobby. No wonder we are lossing frequencies right and
>left.

Thing is, it really doesn't take much in the way of equipment complexity to do a good job on 6 and 2m sideband. Just a decent VXO rig covering the bottom part of the band, and maybe 5-10w out.

The ICOM n02 series of rigs was just perfect; about 5w out, VXO, and enough space for nine C-cells to make the rig very portable. Nowadays, if you want the same functionality, you get all sorts of synthesized trinkets and pay more than twice the price.

Somebody really should call up Martin Ju and suggest an adaptation of their low power HF ssb rigs for VHF...

Friend AC4CS found it, and here it is for the benefit of all dx'ers:

Send an email to qsl-info@aug3.augsburg.edu

Do not put anything in the subject, but put the DX callsign in the
body of the email. Send it and you will receive any DX manager
info in a couple of hours. I have found it to be extremely accurate and up
to date.

73, Tom WB4iUX

This seems like an uncalled-for crack to me. The evidence is that the people working to issue amateur radio licenses are working very hard indeed. Based on my experiences, I don't think that the federal government is better or worse than most other work areas in terms of employee competence and dedication. Sure you can find people who do a horrible job, but you can find those in the private sector as well. If you look at the technical fields, you easily can find people in government who do an excellent job and who have made significant contributions as well. Plus they do this in an environment subject to meddling by purely political entities. Would the Hatch act sound like a reasonable limit if you worked in private industry?

Can't see any partiular problem ith your proposal for UK amateurs as I guess most will get the news from other sources. Perhaps you could continue the existing format here and mail the ax25 format directly to those who have requested it. This would get round your worry about it being sent @WWW as you could obtain specific assurances from the recepients. The rest of us can continue reading the news here in its existing format.

>Oh, and there is plenty of QRM, fading, etc. there so you get the full effect.

Almost, if that fading is fast enough to chop letters in half. Real challenging copy includes a slurring vibroplex fist, a long-path echo, a heterodyne, sudden QRN from a neighbor's appliance, and a KHz of drift.

A morse program with a sound board could do all of those effects. So could a cruel Volunteer Examiner. :-)

I just passed my 13 wpm code test upgrading to general, so I would like
to input what I think.I did find a big difference between the cw computer
programs and real world cw qso's. Working cw really trains your ear to
here those fading signals. I have had qso's where half-way through the
signal eithers fades out entirely, or qrm kicks in drowning the other
person out. But, I have gotten QSL cards from these hams so it wasn't a
total loss. There are clubs in my area that send code practice sessions
over vhf and 10 meters. Most of my getting the speed from 5 wpm to 13 wpm
was by working cw qso's evry night on 7100-7150 Mhz.I started answering
faster and faster cq's so I had to concentrate and copy faster.

The 3-Hr Ap Indices for 22 AUG 94 are: 6 6 3 5 10 8 12 19
Greater than 2 MeV Electron Fluence for 23 AUG is: 4.9E+06

SYNOPSIS OF ACTIVITY

Solar activity was very low. There were no events over the
past 24 hours. New Regions 7769 (N10W47) and 7770 (S07E40) were
numbered. Region 7770, a DAO group, made a rapid appearance but
has produced no flares yet.

Solar activity forecast: solar activity is expected to be
very low to low. Region 7770 has some potential for C-flare

production.

The geomagnetic field has been at quiet to unsettled
levels for the past 24 hours.

Geophysical activity forecast: the geomagnetic field is
expected to be quiet to unsettled for the entire forecast
period. High latitude stations may experience occassional short
periods of active levels, during local nighttime.

Event probabilities 24 aug-26 aug

Class M 01/01/01
Class X 01/01/01
Proton 01/01/01
PCAF Green

Geomagnetic activity probabilities 24 aug-26 aug

A. Middle Latitudes
Active 30/20/20
Minor Storm 15/10/10
Major-Severe Storm 05/05/05

B. High Latitudes
Active 30/30/30
Minor Storm 15/15/15
Major-Severe Storm 05/05/05

HF propagation conditions were near-normal over all
regions. Transauroral paths experienced periods of minor
signal degradation. Near-normal propagation is expected to
continue over the next 24 to 72 hours. There may be some
periods of additional minor signal degradation on transauroral
paths over the next day or two.

NOTES:
All times are in Universal Time (UT). Characters preceding begin, max,
and end times are defined as: B = Before, U = Uncertain, A = After.
All times associated with x-ray flares (ex. flares which produce
associated x-ray bursts) refer to the begin, max, and end times of the
x-rays. Flares which are not associated with x-ray signatures use the
optical observations to determine the begin, max, and end times.

Acronyms used to identify sweeps and optical phenomena include:

II = Type II Sweep Frequency Event
III = Type III Sweep
IV = Type IV Sweep
V = Type V Sweep
Continuum = Continuum Radio Event
Loop = Loop Prominence System,
Spray = Limb Spray,
Surge = Bright Limb Surge,

EPL = Eruptive Prominence on the Limb.

3070. Gel cell problem

Newsgroup: rec.radio.amateur.misc
Date: 1994-08-24 06:50:07 UTC
From: caldwell@merlin.etsu.edu
Message-ID: <33eqiv$278@hermes.oc.com>
Source record: 261219

During a recent move, I accidentally let one of my Gates 25 Amp hour 12 Volt batteries fully discharge and stay that way for some (appearently to long) length of time. Now the best voltage I can charge it to is about 10.5 Volts. I assume from that measurement that I have let a cell go bad. (This type of battery has 6 cells rated 2.1 Volts, 25 Amp-hours each.)
I remember seeing a discussion about this some time ago in which someone said that the fix was to charge the bad cell individually at relatively large current and voltage (V > 2.1 Volts, can't remember what the current was supposed to be).

Does anyone out there have that information handy ? If not that, my second choice would be an address and/or phone number for Gates.

Any help will be appreciated.

3073. PLSE INCLUDE SASE FOR DIRECT DX QSL CARDS!!!

Newsgroup: rec.radio.amateur.misc
Date: 1994-08-24 11:09:57 UTC
From: slm@world.std.com
Message-ID: <Cv1DoL.5s1@world.std.com>
Source record: 261223

I just returned from 2 weeks portable S5, and very much enjoyed working some big pileups. Already, there are over 100 QSL cards here for us in the first couple of days back in the States.

I am dismayed, however, by the number of cards that are coming in direct without return postage.

For the DX-ing newcomers out there:

IF YOU HEAR A DX STATION WORKING BIG PILEUPS, AND YOU WANT THE CARD DIRECT, PLEASE INCLUDE A STAMPED, SELF-ADDRESSED ENVELOPE!!!

If you are ragchewing with some station in the States and want to exchange QSLs, that's one thing. I never mind exchanging cards direct with someone, if I've worked them from home (Massachusetts).

But please try to think about a DX station who is working hundreds or thousands of contacts a day. It is really unreasonable to expect them to foot the entire bill for postage.

For example: I was often working 3 QSOs a minute. If you figure 2 were Stateside and one was in Europe ... if all those hams sent me cards direct, without return postage, that would cost me $1.08/minute to be on the air. It would be cheaper if I stayed home and telephoned Slovenia, and paid the international telephone rates, than to be on the air with costs like that!

I don't expect people to include "green stamps" ($1 bills) in addition, to help with QSL expenses -- it's very, very nice, the few people who do that, and much appreciated. I am willing to pay the costs of my own QSL cards, that's part of the DX-pedition cost.

But I can't afford 2 weeks on the air at $65/hour in postage costs! The cards that are coming in direct without return postage will probably be answered via the bureau.

Thanks,

Sharon

Dave Newkirk (WJ1Z) (dnewkirk@arrl.org) wrote:

: More news coming in a subsequent *QST*, but we have discovered that the
: lower-cost answer--and one that should provide practically the same IMD
: reduction at amateur frequencies--is to use *Motorola MPN3700* diodes
: instead of the HPs.

Did IMD testing get done at the LF end ? most PIN diodes have long
enough periods for use above 10MHz, but parts that work well down to 1
MHz are less common.

: We will also show that 1N4007 rectifier diodes, although they contain PIN
: structures that can provide reasonably good IMD performance compared to
: intended-for-RF-switching PINs like the 3081 and MPN3700 *in forward
: conduction*, *aren't* a suitable low-cost answer to the 3081 and 3700
: because they must be *reverse*-biased to exhibit similar "turned off"
: IMD dynamic range compared to 3081s and 3700s that simply have forward bias
: removed.

I remember seeing someone trying to use 1N4007s in a switch-mode
PSU. The things were evidently so slow that they must be close to their
limit of usefulness as a 60 Hz rectifier. 1N4007s have been used in 100W
TR switches before now, but plenty of reverse bias voltage is essential
to get isolation in the off state and this won't be available in a
retrofit job.

I wonder about the switching diodes at the inputs to the main IF
filters, there may be a further benefit to close-in IMD of signals that
pass the first IF. I've not tried this, but I feel suspicious about
them. Measuring the IMD of crystal filters can be fun. Mixers and amlifiers
can now be built at home, for pocket money, that make the quartz the
limiting factor ! LF filters like the old European 1.4 MHz ones,
with their large lumps of quartz usually produce better results than the
more modern HF filters.... note that some filters had input
transformers that were very poor for intermod performance.

Cheers
David

Rob,

Try a loop antenna. There is one in the May, 1994 issue of QST with dimensions
for 40m.

Good Luck and 73

Call the FCC Database at (717) 337-1212 and follow the voice prompts with your touch tone pad. (i think there used to be someone in the Gettysburg area that used to drop by the offices and pick up the complete list including the outlying territories - these aren't on the tape recordings on the phone. The info he had was being posted to the usenet and to packet radio..

if i recall, the individual started getting grief from people over this since he "was doing the same thing the ARRL was doing" (except he wasn't - he had a more complete list). Eventually, he changed jobs or was graduated from school or something and announced he was going to stop doing this.

Amazingly, the ARRL feed seemed to get "slow" when he stopped. A co-inky-dink? All because some in the communications world didn't want to handle getting "two" of something (even tho one was a complete list and the other was just the US 50 states...) surely, there must be someone in the Gettysburg area that's just ready to do this job for us. yeah, yeah - don't call me shirley.).

I had a claim under the Albert Wohler Insurance (ARRL) recently due to a lightning strike. I filed it, sending receipts for replacement and all that - I purchased at a hamfest to keep the cost down. They informed me I had to send written proof that the items were not able to be repaired from a service shop. I called and asked if that cost was covered and I was told, yes it is. For 3 items, I spent almost $60 to have a shop verify that, yes, indeed, the melting down of parts caused the items to be not able to be repaired. I then submitted the statements and the receipts for the inspection. I received my check for the replacement cost of the items less the deductible, but nothing for the inspection. There was a note with the check that "we require the owner to provide the repair estimate and we do not reimburse for that." I am not pleased as I could have used some other service for the estimate. I also could have purchased items at new retail prices instead of shopping at a hamfest. The claim was processed quickly, however. I guess the insurance is worth having, but I am not happy about the estimate cost. In the future, if I have another claim, I will certainly replace with items at whatever cost for brand new.

:

Difficult ! How available are US stamps in other countries?
As some DXpeditions originate in countries other than the US, this means
that we all need ready access to valid postage stamps of several
countries, and also to know the correct value.

I thought this was what the IRC was supposed to fix

: I don't expect people to include "green stamps" ($1 bills) in addition, to
: help with QSL expenses -- it's very, very nice, the few people who do that,
: and much appreciated. I am willing to pay the costs of my own
: QSL cards, that's part of the DX-pedition cost.

This is rare indeed in DXpeditions, some seem to want to make a
profit on cards, most seem to want all their card-related costs
covering. Those who wish to EXCHANGE cards are a delight to meet.

: But I can't afford 2 weeks on the air at $65/hour in postage costs! The cards
: that are coming in direct without return postage will probably be answered via
: the bureau.

The bureau is fine, anyone wanting a card in a hurry is trying to
impose extra work on you for their own advantage, expecting them to
cover the extra costs seems fair and proper to me.

Just think of what will happen to those cards....

They will be valued more highly than the actual QSOs
They will be displayed and flaunted
They will be used in applications for awards (to be displayed and
flaunted)

I think that a lot of this hobby revolves around cardboard and
postage rather than radio equipment and propagation. I could just

imagine the stir caused if I did a non-QSL card DXpedition ;-)

Cheers
David

> have yet to see a copy hit my mailbox.
>
> Could you please see that a current catalog is sent to me?

A catalog for Ham equipment will be in the mail this afternoon or in the
morning
and you're now on the mailing list. Based on the newsgroup this came from
I'm
assuming you don't need/want a test equipment catalog - If I'm mistaken, let
me
know and I'll have you added there as well.

I'm not sure why you weren't put on before, but it's now taken care of and
you'll
get catalogs forever (you only THOUGHT it was hard to get on a mailing list -
just wait till you try to get off of one ;)). If you don't get this one
in the next
week or so, send me another message and I'll tell the boss I need to
hand-deliver
a catalog (I need to get out of the heat for a while anyway).

Dennis Little - Official programmer with that catch all clause at the end
(and other duties as needed - I've even played
receptionist).

> I thought this was what the IRC was supposed to fix

You are right, of course, I directed the STAMPED, self-addressed
envelope to the American audience here .... a self-addressed
envelope and IRC are quite welcome from overseas! The request is for
return postage ... and, by the way, the self-addressed envelope is
highly appreciated as well. If you have a pile of 100 cards to do one
night, having to write out envelopes is quite time consuming.

I got a letter from an S9 ham, who saw my article in QST in May
(also urging people to include return postage) ... she said she
really doesn't like it when people don't include the self-addressed,
return envelope, it's quite time-consuming and "breaks the rhythm"
of working on a big stack of cards.

> I think that a lot of this hobby revolves around cardboard and
>postage rather than radio equipment and propagation. I could just
>imagine the stir caused if I did a non-QSL card DXpedition ;-)

As could I! :-)

3090. Yaesu FT-840 Mods?

Newsgroup: rec.radio.amateur.misc
Date: 1994-08-24 15:10:24 UTC
From: newmedia@teleport.com
Message-ID: <newmedia.14.000F2CD1@teleport.com>
Source record: 261152

Can anyone direct me to mods for the new Yaesu FT-840? Thus far, the only ones I've seen cover the FT-890, which uses a lot of the same subsystems internally. But I am not inclined to try those on a "similar" radio like the 840 - which, by the way, I think is one hot little rig.

I'd appreciate any help.

AUGUST

August 28, Sunday: Woodstock, IL - Tri-County Hamfest, Sponsor: Tri-County Radio Group, Inc. McHenry County Fairgrounds, Rte. 47 Junst North of Rte. 14. (Only 14 miles North of I90 on Rte. 47.) Advanced Tickets: $4.00, At The Door: $5.00 For advance tickets send check to: T.C.R.G., P.O. Box 3107, Skokie, IL 60076-6107 Information: 708-658-1678 Talk in on: 146.52

SEPTEMBER *

September 11, Sunday: Joliet, IL - Bolingbrook ARS Ham/Computerfest, Inwood Recreation Center, 3000 W. Jefferson. This is a medium size hamfest with indoor/outdoor flea market. Gates open 8 AM for general public. Outdoor flea market on paved lot -- setup at 6 AM. Use Exit 253 from I55, or Exits 126/130 from I80. Admission $5. VE testing 9 AM - 12 noon. Bring original license and photocopy, ID and photo ID, plus $5.75 test fee. Novice-only tests are free. Talk-in 147.33, 224.54, and 443.525 MHz repeaters. Indoor table reservation, call Ed Weinstein at 708-085-0527. Info, BARS Hotline (708)759-7005 between 6 AM and 9 PM. |

September 11, Sunday: Chicago, IL - Vintage Audio Fair |
The Vintage Audio Fair, organized by the Chicago Vin- |
tage Audio Society will be held on 11 Sep 1994 at |
Irish-American Heritage Center, 4220 N. Knox, Chicago, |
IL (vicinity of I94-Edens Expwy and Wilson Ave). We |
expect about 30 exhibitors and 300-500 people attend- |
ing. Admission is $5.00, table - $75.00. For more info |
call: days: 312-545-2641, nights: 312-338-1042. Mail |
your inquiry to: 5308 W. Lawrence, Chicago, IL 60630. |
The show is for all MacInstosh - Marantz freaks, tube |
maniacs, audiophiles, musicians, aficionados and all |
alike!

September 17-18, Saturday & Sunday: Peoria, IL - Superfest. Admission $5. For more info call (309)685-6698. Talk in on 146.76 (-600 kHz offset).

September 24-25, Saturday & Sunday: Grayslake, IL - Chicago FM Club, Ham Radio Expo. This is a large hamfest with indoor and outdoor flea markets. Lake County Fairgrounds, Rts 45 & 120. 6AM - 6PM. Info 146.76 MHz (-600). Admission $6 at gate, one ticket good for 2 days. Kids under 12 free.

OCTOBER

October 23, Sunday: Waukesha, WI - Kettle Moraine Hamfest Sponsor: Kettle Moraine Radio Amateurs Waukesha County Exposition Center Forum Building, Highways J and FT All orders MUST be accompanied by a SASE and mailed to: KMRA Swapfest, P.O. Box 411, Waukesha, WI 53187-0411 General Admission - $4.00 ($5.00 at the door)

NOVEMBER 1994

November 19-20, Sat.-Sun.: Fort Wayne, IN - Fort Wayne Hamfest Sponsor: Allen County Amateur Radio Technical Society (ACARTS) Allen County War Memorial Coliseum Exposition Center Admission: $5.00 (No advance ticket sales.) For information or table orders, send a SASE to: ACARTS, P. O. Box 10342, Fort Wayne, IN 46851 or call John Rufner at 219-483-6305 (table info) Don Gagnon at 219-484-3317 (general info)

Nov 27, Sunday: Wheaton, IL - GMRS of Illinois May Fest '94. Admission $5. Starts 8 AM. Setup 6 AM. Info, call (708)690-1492.

COMPUTERFEST SCHEDULE

September 17, Saturday: Kankakee, IL - Computer Fest 1994. Sponsor: Kankakee River Valley Computer Users' Group. Kankakee County Fairgrounds 9:00 a.m. to 3:30 p.m. Admission $4.00. Information: 815-935-8590 or 815-935-1605>

Computer Central, College of DuPAGE, Main Arena of the Physical Education Building Park Blvd & College Road, Glen Ellyn, Il. 708-940-7547 $5 with card Normal admission $6.00 Opens 9:30 am - 3:00 pm

I had this package suggested to me. I got the package from Oak.oakland.edu.
It has a minimal learning package attached, along with the comments that what
is supplied is not designed to be used to learn the code, but rather as a
example of how such a package might be implemented. Other than that, it looks
real nice. does anyone have a full set of learning libraries for MorseTrainer??

Well, as one of those in the process, _and_ the latest requester for code s/w :) , it seems to me that there are two skills here. One is learning the code itself, and the other is copying QSOs. True?? Not true?? Anyway, it would seem that the computer would be a good substitute for a code practice machine to learn the code and get your speed up a bit. Then you would be able to start making sense of what you hear on the air. This may be utter nonsense, but thats the theory. Anyone have contrary opinions?

MA>insurance on all your equipment - whether lost or stolen, including
MA>lightning protection (except antennas).

Having had a lightning strike, I was about to take on that ARRL
insurance (as usual after the horse has been stolen!), but
you say "except antennas". What in tarnation would lightning
insurance be for if not antennas? In my case the rotator was
destroyed. I'm looking at replacement rotators in the $1K category.

3096. What antenna connector is used on an HTX-202?

Newsgroup: rec.radio.amateur.misc
Date: 1994-08-24 16:25:11 UTC
From: jackson@longlast.cs.nyu.edu
Message-ID: <33fs97$25q@thecourier.cims.nyu.edu>
Source record: 261158

I am building the "cheap-but-good" 2m antenna from 7/94's
CQ, and want to know what connector is used by the HTX-202.

I'll be using it to help nail down packet CRC's with my
Pro2005 scanner, so I'm hoping it's a BNC connector. I plan
to buy a 202 in the coming months, so the j-pole will have
to be reusable.

Finally 1.3:1 SWR through the entire band is pretty darn good,
isn't it? Isn't 1:1 electrically imposible to attain (without
something being wrong, i.e. short circuited)?

If I'm wrong, looks like I better get back to the study
guides! :)

Many thanks.

You made a very well-reasoned reply on a subject that may fall in the
"so-what" category (IMHO!!). If you haven't learned 5 wpm for the
Novice/Tech plus exam, and have to resort to inscribing dots and dashes,
there's still hope. You still haven't too much effort invested in that
dead-end technique to learn to actually copy code for the General exam.

Anybody who can pass 13 wpm by any method of writing dots'n'dashes has
invested a _lot_ of effort getting good at that. Effort that would have
been _far_ better spent actually learning code, and effort that would have
led to an ability to _use_ code, e.g., on the air, or to later pass the
20-wpm Extra exam. Anybody who wants to go down this dead-end route has my
sympathy, my awe (it's a _lot_harder_ than learning code), and, if he can
answer his seven-out-of-ten questions correctly, a passing grade from this
VE.

I acknowledge that not everybody who passes a Morse code exam is going to
ever use Morse again. Clearly anybody who learns to copy code as Gary

described has no intention of using it on the air. So he passed his test...so what.

Wayne, on the other hand...no I won't even get started on that! :-)

First, my bonafides. I've been on 4 different DXpeditions in the last decade and a half running the gambit in expense. So I've been on the same end as Sharon.

What I see here saying here is for STATE SIDE QSL's to use an SASE. She didn't say anything about what you do to get a QSL from a foreign station! By all means...use an IRC or two. Also use some common sense!

You managed to run into another bone of contention with me. MAKE MONEY on an expedition? Naaaaaaaaaaaaaaaah.

The first expedition I went on was in 1980. We went to Mauritius, Rodriques, the Comoroes, and Tromelien. The expedition worked something like 30,000 Qs from these different locations. Total Cost was $30,000 to the three individuals that made the trip. (I only went to Rodriques and Mauritius while AA6AA and N6ZV went on to the other locations.)

Even at a $1 a Q, the guys would have broken even! That isn't why they went! The simple fact is that that we collectively spent better

than $10,000 on this expedition after any income from the QSL cards.

This just isn't a money making venture in most casses!

Money wasn't the object of the exercise, fun was!

|>: But I can't afford 2 weeks on the air at $65/hour in postage costs! The cards
|>: that are coming in direct without return postage will probably be answered via

Sharon's reaction makes alot of sense to me too. It is rediculous to expect the
DX station to go even further out of the way than they already have. The
bureau is the right response to folks who are QSLing in the manner that
she is describing.

|> Just think of what will happen to those cards....

Geeze but you hams are cheap bastards. I bought an Icom IC-761 (my second) for $1200. (My first cost $2500) I called Icom when there were some things wrong with it. (Yeah, a few dollars for the call) I then shipped the radio to Washington. (Double boxed so as to arrive intact.) $375 later, it was as good a new. My other radio I fixed when it died. Either way the few extra dollars spent on the phone and on the shipping materials was worth it.

Yes, I'm going to rant some more about this. These are the same people that won't spend the $35 on a service manual because they "Already paid too much for the radio." This is the reason I bought the second 761 for $1200. The original owner (who used to work for DuMont Scopes) thought he was enough of a tech to not need the manual. When he finished with the radio, it was indeed finished. It sat in his garage for a couple of years. (Long enough for his XYL to forget about it, then he sold it for less that 30% of what he paid for it.

Yup, he sure showed Icom about their over priced manuals.

Next time you're put on hold, you can ship me the radio. I'll even pay shipping.

There are two gateways... and only one of which I can remember and that was N6QMY. I forgot the other one as he refused traffic from countries not allowing 3rd party traffic (IE: The UK for example). N6QMY refused to register me as GW0TJO but liked other G0's (I can only assume I am doing something wrong *SOB*) Still, if someone can reproduce the instructions for N6QMY again, I would also be very much in appreciation.

> knows of such a publication?

I too would be interested in this. I guess it would be a fairly weighty tome
... :)

Thanks to all who have taken the trouble to tell me of HR's end. I first saw
it at tech college just after I gained my novice ticket. It was much more
interesting than the local mag's in vk at the time, and most of my lunch times
were spent reading HR. I feel that I learnt a lot just by reading the
technical articles.

As for vk mag's ... we have "Electronics Australia", "Amateur Radio
Action", and the Wireless Institute of Australia's "Amateur Radio". There are
the overseas pub's, of course, and probably some smaller mag's with which I'm
not familiar. The following are purely my *opinions* ...

I first started reading EA as a kid in the late 60's. It was full of articles
written by amateurs. In the late 70's it turned into a "consumer electronics /
hi-fi amplifier and build-this-wonderful-LED-chaser-kit" type mag, and
subsequently lost my readership. It has retained a leaning towards the
technical professional, and often features articles which range far and wide
over the electrical engineering disciplines. The "new" editor (who was on
the staff back in the 60's) was recently following a policy of trying to bring
the amateurs back into the fold.

To me it appears that ARA tends to cater for the contester / dxer types. It
features some technical articles, although I've found some glaring errors in a
few. It also seems to do a roaring trade in rig reviews. I rarely read it now.

In the last few years AR underwent a change whereby some issues are now
absolutely packed with technical articles. There is a general, broad
technical content ranging from "how to" through "homebrew" to "theoretical"
-the majority of articles are in the former categories. There seems to always
be an antenna article of some description, and over the years it has run some
good construction and theory / education sequences. (I once saw an integral
operator in AR. :)) It is a vast improvement on parts of the 80's when most
of the time I barely read it -despite being a member of the WIA. It features

good columns run by dedicated mode enthusiasts, and often caters for the humerous side as well. As a WIA vehicle it deals with the politics / regulatory / representative side of amateur radio, and provides a forum for often-lively discussion.

Source record: 261166

> I have a Cushcraft R7 antenna. It has never been satisfactory. It resonates
> on some bands and not on others.

>Yes! I had an R5 which worked fine until it got hit by lightning and now
>have an R7. Both worked right out of the box and resonated almost right
>where Cushcraft said they would.

While at VP8BZL, waiting for the boat to Peter I, we set up, amongst others,
an R5, 5" off the ground and used it for most of the phone contacts on 10,
15 and 20, and all of the cw and phone Q's on 12 and 17m. All of the
contacts were barefoot.
We used the same antenna on 3Y0PI as spare (for the A3WS we had) for a lot
of the phone Q's on 12 and 17.
So yes, it worked (part 1), for a compromise antenna that it is.

Recently, back in Belgium, we did a test with 4 verticals on one row (Gap
Eagle DX-VI, Butternut HF6V-X, a homemade vertical and an R7).
The SWR of the R7 was:
28.000: 1.3
28.500: 1.1
24.930: 1.3
21.000: 1.4
21.300: 1.5
18.130: 1.8
14.000: 2.1
14.250: 2.1
10.100: 1.85
7.040: 1.7
(eat your heart out - hi).
My guess is that with a bit of tweeking, we could get the swr on 20m lower.
Concerning performance, in comparison with the other 3 antennae, it came out
as "being comparable" to the Gap. The Butternut and the homemade antenna
(design ON4UN-hi) were, in general, better than the Gap or the R7, certainly
on the lower bands. That is the 'vertical' compromise: no radials=less
space=less performance.
From a mechanical contruction point of view, the R7 was the best antenna.

So, yes, it works (part 2)

Some tips (might seem ridiculous, but...)
Check the coax line.
For swr checks, and adjustments, connect the swr meter to the antenna itself
with a 2x male connector.
Start adjusting the traps from bottom up or top down.
As the traps are cascaded, check for faulty traps of the highest low band
which works - 40 in your case - or lowest high band which does not -30 m in

your case, I think.
Check the matching unit (the big black box).

If nothing works, turn one of the radials to Mecca. hi.

GL! Peter-ON6TT.

This message is designed to respond to the kind responses and the lectures I got from some golden spoons who can afford the most expensive gear in the world and who are willing (?) to pay for a license. (Didn't know I hit such a sore spot with many of you). Normally I roam the railroad net.

Understand a few things: I have no problem with anyone taking time to do a job. I do have a problem when they tell me it will take 6 to 10 weeks. I start counting on that. I do not understand your comments about license questions changing. We walked into a computer show ne one day and heard about ham radio. First time I ever heard of that. Sounded neat. Got info, studied and passed the test. Upgrades and all that stuff you guys talk about. Gimme a break. Trying to understand what an HT is now. There are a ton of different transmitters out there and it's quite intimidating to a newcomer.

If the government changed computers, changed tests, changed governments, fixed the potholes on the info highway, it does not matter to me. The FCC was established by Congress to administer this program. That is their clear duty. They wanted it so badly that they have done for some 50 or more years. They get oddles of OUR tax money for that. If I run my businesslike they do, I would not have any customers left. I had high hopes that this bein such an elite exclusive rich peolepeople people hoby that the FCC would handle it quicker.

I did call them and they heard of us. They assured me (I WAS nice) that everything would come by snail mail. :)

So, back to the railnet. Thanks for the lectures and help from well meaning people.

Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.antenna

Does anyone have experience with the Lightning Bolt quad antennas? I'm looking at either the 10-15-20 or 10-12-15-17-20 model.

73...

: >requirement for an amateur station.

: I'd rather tap a direct feed from talk.bizarre through my TNC than
: put up a 2-meter to 11-meter link using my license.

If you send it over the packet network, I can feed it to a dec-talker and
distribute it on 11meters... who would know the difference? ;) :)

One night I was listening to the local amateur poc repeater when I heard
a lot of upset folks who were ready to call the fcc monitoring station.
Seems the local hams had tired of 75meters and had put their hf remote on
11meters...the cb ers were complaining loudly of amateur intruders!

From: jeffrey@kahuna.tmc.edu
Message-ID: <Cv2FrG.Ho9@news.Hawaii.Edu>
Source record: 261165

It's funny to read this subject line. I can recall back in the 60's when Wayne was at war with the ARRL, and how his editorials stirred folks up; people were cancelling their subscriptions back then.

Regardless of the cancellations his magazine survived.

My collection started with issue #2 or 3 - can't recall - gave it to the Lockheed ARC.

From: bbsuser@kd3bj.uucp
Message-ID: <Cv2Kqw.At2@kd3bj.uucp>
Source record: 261173

Beverage is an antenna. It is also known as the wave antenna. It is
a wire of several wavelengths used to receive, not transmit. The name
Beverage comes from the name of the inventor, Harold Beverage. I
believe
Harold died within the last year. Dig through the index for QST
magazine for more information. You might also try the ARRL antenna
book,
the antenna compedium by ARRL, or the Radio Amateur's Handbook by
the same publisher.

>I would say that CQ is "Calling *any* station", while QST is "Calling
>*all* stations".

Well Mike, that would be the wrong thing to say. Moving from the ham
bands into the commercial bands CQ means `calling *all* stations'.

Why would a shore station, prior to sending the WX, want to call
for `any' station/ship?

Why would a naval vessel, prior to at-sea missile testing, want to
call for `any' station/ship?

Both these examples illustrate that (on the professional frequencies)
CQ is the general call for *all* stations.

3124. Standard C520 - CTCSS

Newsgroup: rec.radio.amateur.misc
Date: 1994-08-25 06:25:19 UTC
From: toms@hpcltr08.NETh.hp.COM
Message-ID: <9408250625.AA17595@hpcltr08.neth.hp.com>
Source record: 261080

Again a technical question...

Recently I installed a CTCSS tone squelch circuit in my C 520 dual-band handheld.
At first, the tone squelch seems to operate correctly.
After some time, however, I noticed that I missed some stations which used the
same sub-tone...
It occurs only on 70 cm, and sometimes the stations can be heard intermittently.
I verified the tone squelch sensitivity by applying an accurate signal from a
synthesized signal generator (HP8663A) with the appropiate sub-tone modulated
on it. The deviation on VHF has to be set to 300 Hz for opening the tone squelch,
on UHF, however, it has to be set to 700 Hz...
This may be a little too high, and might be the cause for this prblem.
This indicates that the stations which can be heard have a relatively high
CTCSS deviation.

I tried to cure the problem, but there are no related adjustments in the set for
correcting this.
I verified the detector circuit (linearity) and also checked that the receiver
frequency accuracy is correct.
Did anyone have similar problems with the C520 and the CTCSS circuit??
What is the nominal CTCSS sensitivity for a receiver expressed in the deviation
of the sub-tone??

Please help...

When I was there several years ago (1992), all you had to do was find the "Radio" room. As I recall, the current radio room is not the same as the room used when the QM was actually in service. The current room was located a deck below and just aft of the bridge (if memory serve me correctly).

I also read that the QM was closed (or at least Disney, which ran the QM exhibit) and the attraction was closed. But I may not have my facts straight.

If you have not performed any mods to the rig, that is why it
will not work. There is a diode-removal mod which enables the crossband repeat.
The manual doesn't say so, but you need the mod. Contact your dealer,
or look at the mod files available on ftp servers such as
nic.funet.fi pub/ham/rigmods

also, be sure to identify if your rig has the "green Jumper" board
or the earlier one. the extended rx and tx mods are slightly
different. I would suggest downloading all of the th78 mod files and reviewing
them thoroughly.

73 and good luck

You're right! The original radio room was behind the wheel house and had an old spark gap radio in there.

The new radio room was was down a deck and was in use by a Long Beach ham radio club. I remember seeing a lot of digital equipment AEA PK-232 and computers ect.

I think Disney sold the property when Long Beach refused their tax demands.

<sigh>

There are NO mods for the HTX-202 for extended anything. It ain't designed to
have anything other than 2 meter signals go in or out through a helical filter.

I add bigger battery packs, better antennas, and speaker-mikes to mine. They
do help make them more handy.

Of course, I don't miss the intermod and overloading wide-band receivers are somewhat
prone to.

Great radio for a single band, and cheap (relatively) too. I have a pair of them.

Why, gee, we're so awfully impressed with how much money you have to spend on your radios.

> Yes, I'm going to rant some more about this. These are the same people
> that won't spend the $35 on a service manual because they "Already paid
> too much for the radio."

I happen to have the service manual already for this rig, so I guess it looks like you don't know what you're talking about, now doesn't it?

> This is the reason I bought the second 761 for
> $1200. The original owner (who used to work for DuMont Scopes) thought
> he was enough of a tech to not need the manual. When he finished with
> the radio, it was indeed finished.

Unlike your friend, I know I'm NOT enough of a tech to repair this rig myself, even with the help of the service manual.

My beef is with ICOM (and so many other companies, especially companies that deal in micromputer equipment) being completely inadequately staffed or organized in their service departments. I don't *mind* paying for long distance phone calls of whatever duration is necessary to resolve whatever problem I have. I don't *mind* paying repair bills to people who know what they're doing for fixing my equipment. I *do* mind this senseless being put on hold for five, ten, fifteen, or twenty minutes (yes, I have been on hold for 20 minutes before on MY nickle) while my long distance meter's ticking - because when they finally get around to answering the phone, I *still* have to pay for the rest of the call. I would even be perfectly willing to leave my number so they can call me back *collect* when they have time, but they don't give me that option.

> Next time you're put on hold, you can ship me the radio. I'll even pay
> shipping.

Okay, I charge $1500 for shipping. ;-)

I have a problem with this sig, I know what a driveway is but I do not generally drive on a parkway, whatever one of those is. I assume it is the path that goes through a park? There is a parkway station, but again one would never drive on it as the roof would collapse.

Here in France the GSM system is very very inexpensive. In fact
some store sell one to you for FREE (but you have to subscribe for one
year to a telephone company). Also they are two operators of the GSM in
France (a third one is expected for soon!) so the competition between
them is very hard and the price decrease a lot. For example in the
beginning of the GSM (3 years ago) a such device cost 6000 FF (1 US$
for 6 FF) now you can find some at less than 1000 FF. It's totally
crazy (especially for scanner listenner). Moreover the GSM system is
scrambled so there is no {easy} way to listen them.
So I am very surprised to learn that in the US the digital
cellphones are so expensive.

My XYL is waiting patiently for her ticket, she tested on 15 July- 6 weeks ago.

I called the FCC today and their recording talked to me. It said that
their computer system is currently down. It also said that it is taking
10-12 weeks to process the paperwork after it is received by the FCC.

Here is the callsign update as of August 1, 1994 for the 9 area:

AA9LL
KF9WU
N9YCQ
KB9JAN

I didn't get any other districts other than 9 and I didn't talk to a human.
The license I delay could be my XYL's!

>... :)
>Thanks to all who have taken the trouble to tell me of HR's end. I first saw

i always liked the cover art before it turned into the Yet Another Boring Magazine photo cover. The guy that did those made good use of a minimalist approach to artwork that combined with the otherwise black & white cover was pretty striking. I think Alkanprint had some QSL cards designed by him and they were available for a short time...the guy that ended up doing the cartoon covers at the end i guess wasn't bad once you got tuned into his thinking but he wasn't "Gil" either.

If Fisk hadn't inconveniently died, HR might still be with us today.

I believe Buckmaster Publishing sells the entire collection of Ham Radio on Microfiche. Seems it was around 250-300$US. there's been some discussion about trying to clear the way for the library to have a copy of this work, but it's still up the air. all the slides are supposed to fit in a recipe box with room left over.

anyone have access to the fiche and is it good quality?

(would it be practical on CD Rom? or pointless since it would probably be scanned pictures?)

and speaking of amateur radio cartoonists...I guess no one's found a replacement for "Gil" yet. I would say Beasley's getting there, but he doesn't have the subtlety. the guy QST/ARRL used for a lot of their stuff was OK, i guess, even tho i didn't really care for him -- seems like he was from that cartoon shop that existed in "bloom county" at times ("I _said_ FUNNIER! <whip><crack>...) only "cuter".

So what is the difference from when I learned the code from records/tapes
back in the early 60's? I still listened to HF to "hear" actual QSO's.
I see no difference from learning from a Computer - Tape - or yeh a vinyl
record. I still have my 78rpm LPs from the U.S. Army Signal Corps - this
hiss, and scratches sound like an HF QSO :-)

Also consider an indoor, coil-shortened dipole. See the ARRL Antenna Book
for information on shortening dipoles.

Or how about a mobile whip stuck out a window, with a quarter-wave
counterpoise underneath (assumes you're above the second floor, and that
you'll retrieve it when you're not operating--just chuck it out the window
when you're on the air, and haul it back in when you stop).

SYNOPSIS OF ACTIVITY

Solar activity was very low. There were no events of note.

Solar activity forecast: solar activity is expected to be
very low.

The geomagnetic field has been at quiet levels for the
past 24 hours.

Geophysical activity forecast: the geomagnetic field is
expected to be quiet to unsettled for the entire forecast

period.

Event probabilities 25 aug-27 aug

Class M 01/01/01
Class X 01/01/01
Proton 01/01/01
PCAF Green

Geomagnetic activity probabilities 25 aug-27 aug

A. Middle Latitudes
Active 20/20/20
Minor Storm 10/10/10
Major-Severe Storm 05/05/05

B. High Latitudes
Active 25/20/20
Minor Storm 15/10/10
Major-Severe Storm 05/05/05

HF propagation conditions were normal over all regions.
No changes are expected over the next 72 hours. Near-normal
propagation conditions will continue through at least 27 Aug.

EVENTS WITH SWEEPS AND/OR OPTICAL PHENOMENA FOR THE LAST UTC DAY

Date Begin Max End Xray Op Region Locn Sweeps/Optical Observations
------ ---- ---- ---- ---- -- ------ ------ --------------------------
NO EVENTS OBSERVED.

NOTES:
All times are in Universal Time (UT). Characters preceding begin, max,
and end times are defined as: B = Before, U = Uncertain, A = After.
All times associated with x-ray flares (ex. flares which produce
associated x-ray bursts) refer to the begin, max, and end times of the
x-rays. Flares which are not associated with x-ray signatures use the
optical observations to determine the begin, max, and end times.

Acronyms used to identify sweeps and optical phenomena include:

II = Type II Sweep Frequency Event
III = Type III Sweep
IV = Type IV Sweep
V = Type V Sweep
Continuum = Continuum Radio Event
Loop = Loop Prominence System,
Spray = Limb Spray,
Surge = Bright Limb Surge,
EPL = Eruptive Prominence on the Limb.

3155. Re: Ragchewing conversational protocol

Newsgroup: rec.radio.amateur.misc
Date: 1994-08-25 17:35:12 UTC
From: papo@briscas.gamekeeper.bellcore.com
Message-ID: <33ikog$2mu@athos.cc.bellcore.com>
Source record: 261106

Ragchewing conversational protocol.. Hmmm.. I'm having problems
with ragchewing myself so I'm going to write a couple
of things regarding this subject, but first a question, how's the
best way to talk throught an HT? I am having a hard time being understood
at the other end and I do not know if it is the rig or if it is me or
what's the problem.

Anyway, I'm starting to get dissapointed with VHF ragchewing, I've seen
better opportunities for conversation in a bar full of couples.

|> > Many amateurs appear not to have good conversational skills in any
|> > event, and many contacts are repetitive and boring. If most amateurs

That's true, this also happens also when you are monitoring CW.
All the times is just:

CQCQ... DE XX#XXX
XX#XXX DE YY#YYY
FB FB FB UR RST IS ### ### MY NAME IS FOO FOO FOO
MY QTH IS FOOVILLE FOOVILLE MY RIG IS FOOTRONICS 1000
MY ATN IS DIPOLE ...weather.. etc. you get the picture.KN

YY#YYY repeats the same thing as above

And then TNX FER TRAFFIC 73 .. The end.

Repeat the same until doomsday.

|> > of geeks and loners.

Well, maybe because people do not know what to say. It is hard to sit down
and talk, specially if you are introvert. Many of those loner and geeks
are introverts, they might feel more comfortable doing CW, packet or
RTTY than phone. Being in front of a mike can be sometimes intimidating.
Then you might add other factors, like talking in a second or third language
(that's my personal case), when you are talking in a second language is
is just hard to ramble because you are not taught how to ramble in
a foreign languate, everything is pretty much "goal oriented".

|> "I could never figure out if one needed the personality hang-up first
|> to get a licence, or if one got it after one was licenced." :)

May I quote him.. :)

|> support in order to keep our hobby in the 2000's) only see the wierdo's, i.e.
|> the geeks and loners described above. A friend of mine once listed a basic set

Well, geeks and loners (as described above) are usually technically inclined.
people that are not technically inclined usually get a CB or a Cell Phone
(one because you look rough and the other because you look
sexy and sophisticated). Well, not all the geeks.. those artsy people look kind
of geeky to me :).

But as I said before , being introvert (a more accurate term) can be the
cause of those 'boring' conversations. And Being introvert is not a bad thing
,I'm introvert myself last time I took a personality test, usually Introvert
operators are better "goal oriented" (i. e. Net Controllers, Emergency
Communications, Packet, etc..) operator than Extrovert operators (non loner or
geek)that are better "rag chewers" over phone. That's my perception.

|> occupation in which one spends most of one's time *physically* isolated from
|> others. Try this one on yourself: ever tried sharing a shack with another
|> op? :)

Err.. I could explain how I did it with my GF but it would not be appropiate
to this forum :D :D :D. But yes, introverts do those kind of things
alone. Ham Radio, or Computers, or Modelling they are usually good at
non participation sports like Chess or Racqetball or Swiming (I am a lousy
baseball player but a fairly good swimmer)

|> places, i.e. the world in which we live. Ham radio can be like death and
|> taxes: it's a great leveller, as you cannot be prejudiced about the other op -

Even with a weird accent over VHF phone? I'm honest with you that still
scares the hell out of me.

Anyway, my first encounters on ragchewing have received mix feelings
or they either do not understand me or I'm sounding muffled or the
HT goes to the sandbox or whatever. I have to do something quick or my HT
is starting to become of part of endangered species and might become
extinct (I live in a third floor.. hint hint. :)).

sigh It looks like I have to either joint to a club or shy away from VHF phone
for a while and do CW, I might have better luck.

Other than that, '73 I'll drop from soap opera mode.

3156. Re: learning CW

Newsgroup: rec.radio.amateur.misc
Date: 1994-08-25 18:04:58 UTC
From: papo@briscas.gamekeeper.bellcore.com
Message-ID: <33imga$2mu@athos.cc.bellcore.com>
Source record: 261107

In article <3397dj$rsb@geraldo.cc.utexas.edu>, oo7@astro.as.utexas.edu (Derek Wills) writes:
|> in learning "the code". Some of us real oldies who were born before
|> there were such things as computers learned our CW by listening on the
[chomp]
|> I'm curious to know whether those who learn it from computer programs
|> that send perfect code in a quiet room find it a shock once they get
|> on the air and have to contend with real people sending code, fading
|> signals, QRM, all that stuff? Is it easy to make the transition to
|> the real world?

Hello!

I learned CW using different medium. I started with computer alone and I just could not do it. I did not have the will nor the time to finish the whole course. I had to do it the old way. I got tapes and I learned from tapes. After I learned the whole alphabet I tried to tune my SW radio and copy. And it was hard. The first times on SW radio were not easy, I'll tell you, the real as you say is not as easy as on the tapes or computer. However the computer program can be used to make the transition from CW tapes to Real World (TM) listening. And so I did After learning the alphabet, I use my computer for simulated QSO's, I reviewed them on the computer and then after I got confidence, I went to the Real World (TM) and copied a bunch of QSO's. I did that every night for two hours straight until the day of the test.

I used a program called MTrainer for the Amiga Computer and Super Morse on the PC. MTrainer has many cool features like simulated noise, simulated QSO's with different speed, tones and waves. Because you can control those conditions manually you can practice from perfect conditions to copying a 1 nanowatt QRP station at the other side of the world. :). IMO MTrainer is an excellent program to get used to Real World conditions and at least it gives you the chance to review your copy against the computer's one. OTOH, Super Morse has the ability to train your ear for paperless copy, it measures your sending and receiving speed but no noise training. I used the two of them and i bennefited of each programs strenghts.

|> Perhaps it helps to learn the code without the distractions, but it
|> must be a shock to some people - does this turn people off using it
|> even after they have passed a code test?

Not to me.. I'm saving for my HF rig and CQ my way out. :). However I see your point. Other people might feel intimidated the first time they sit down in front of a key, having to pick up your desired signal between three of four ones and all that good stuff (otherwise

it might be the amount of buttons and displays on the rig :))

|> Anyone have any real data on this? Do people who teach the code ever
|> use real radios in class, and do teachers even have students send code?
|>
|> Derek Wills (AA5BT, G3NMX)

That's my personal experience and it worked for me. I passed Element 1B
on the first shot (now I have to go for my General Ticket) first day first
anything. So it looks like it worked for me perfectly. I agree that if
CW is going to be taught on school, the student must have the opportunity
to copy Real World (TM) code. It is fun anyway. :)

Now I'm just wondering if mixing CW short hand and Internet short hand
would be understandable....

Cross-posted to: rec.radio.amateur.misc,rec.radio.shortwave,rec.radio.info

--- SOLAR TERRESTRIAL FORECAST AND REVIEW ---
July 22 to August 01, 1994

Report Released by Solar Terrestrial Dispatch
P.O. Box 357, Stirling, Alberta, Canada
T0K 2E0
Accessible BBS System: (403) 756-3008

A NEW ADDITION TO THE WEEKLY REPORTS
~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~
A new set of graphs have been incorporated into these weekly reports and will remain a regular feature of these reports. The graphs plot the average 10.7 cm solar radio flux values for various numbers of days. For example, the 5-day average 10.7 cm solar radio flux graph plots the solar flux, averaged over a period of 5 days. Similar plots for 10 and 20 day solar flux averages have also been included.

These new plots can be used to aid in determining shorter-term ionospheric propagation conditions and can be used as input into the various propagation programs (ex. SKYCOM) for shorter-term forecasts of HF radio propagation conditions.

SB NEWS @ GBR < GB2RS $GB2RS280894A
MAIN NEWS 28th August 1/13
Good morning. It's Sunday the 28th of August and here is the GB2RS news broadcast, prepared by the RSGB and intended for all radio amateurs and short-wave listeners.

First the headlines:-

Morse tests at the Telford Rally are not free

New RSGB telephone Hotline number

RSGB South West Regional Meeting in Bristol

And a new QSL sub manager for the G3LAA - NZZ series

First, we have an urgent announcement from the Telford Rally Group, organisers of the Telford Rally, who wish to apologise for any misunderstanding that resulted from their advertisement in the August edition of RadCom. They wish to point out that Morse Tests will be run in accordance with the rules laid down by the RSGB - the free item should refer to rooms made available for the Morse Tests by the Rally Group. Further Rally details are covered later on in this broadcast.

September RadCom was posted to all members at the beginning of last week. The leader, on page 4, has details of a new telephone Hotline for members, scheduled to commence on Monday 12th of September. The telephone number given is incorrect, the area code should be 0956 and not as printed. The correct number is 0956 70 73 73.

Early notification of the Regional Meeting for South West England and South Wales: The third RSGB Regional Meeting is scheduled to take place on Saturday the 22nd of October at the New Friend's Hall, Purdown, Stapleton, Bristol. The doors will open at 12.30pm, when light refreshments will be available and the meeting will commence at 2pm. Several members of Council will be in attendance plus HQ staff. Further details will appear in October RadCom and via GB2RS news service over the coming weeks.

The RSGB QSL Sub-Manager for the G3LAA - NZZ callsign series is now Mr D Keely, GW0OGI, whose address is: Pensarn Cottage, Bryn Du, Ty Croes, Anglesey LL63 5SH. He has taken over from Mr A Giles, G4OJH.

A new 2 metre repeater GB3BF, operated by the Bedford Repeater Group became operational on Sunday the 14th of August. The repeater is located at Manton Lane, Bedford and operates on channel R2, which has its output

on 145.65MHz and input on 145.05MHz. Further details and/or reports should go to the repeater keeper G1BWW, whose address is correct in the RSGB Call Book or via packet @ GB7ZPU.

Now attention all amateurs living in the East Highland area of Scotland. The RSGB is looking for more Novice Instructors to cover Wick and the surrounding area. Anyone interested is requested to ask for the booklet 'Novice Licence Training Scheme', which contains the necessary details and an application form. Contact the Amateur Radio Department at RSGB Headquarters by telephoning 0707 659015.

Finally in the main news, SSL has informed the Society that as of last Wednesday morning, the latest callsigns issued were in the G0 Victor Foxtrot and G7 Tango November series, and Novice calls in the 2 0 Alpha India and 2 1 Delta Hotel series. .

DX NEWS 28th August 2/13
Now some items of HF DX news from the weekly RSGB DX News Sheet which is edited by Brendan McCartney, G4DYO.

From Corsica, TK3K and TK3KLS will be aired until Saturday the 10th of September on all bands.

From Bermuda, VP9MZ continues to be active, check 80 metre SSB and RTTY around 2000 to 2400 UTC.

From Belgium, the Ostend Radio Club will use the callsign OS0OST, from Thursday the 1st of September, until Saturday the 31st of December as part of the 50th Anniversary Liberation Celebrations.

And from Gibraltar, the prefix ZG2 may be used by all ZB2 callsigns from Friday the 2nd until Monday the 12th of September to commemorate National Day.

SB NEWS @ GBR < GB2RS $GB2RS280894C
RALLY NEWS 28th August 3/13
Now the rally events for today, Sunday the 28th:

The Coleraine and District Amateur Radio Society Rally is being held at the Lodge Hotel, Coleraine, County Londonderry. Doors open at 12 noon. The rally features the usual trade stands, a bring and buy stall and other attractions. Refreshments will be available. Talk-in will be on two metres, channel S22.

The East Coast Amateur Radio and Computer Rally is being held at the Clacton Leisure Centre, Vista Road, Clacton on Sea, Essex. Doors open at 10.30am. It features trade stands, including radio, computers, software and accessories and a bring and buy stall. Refreshments will be available from 11am. Talk-in to be on channels S22 and SU22.

The Galashiels and District Amateur Radio Society Open Day is being held at the Focus Centre, Livingstone Place, Galashiels, Borders. Doors open at 11am. The event features all the usual trade stands, club stalls and a bring and buy stall. Refreshments will be available.

The Gloucester Radio Rally is being held at Nass Lane, Quedgeley, Gloucester. The site is located just off the old Bristol road, look for the signs. Doors open at 9am. The rally features a bring and buy stall, a car boot sale and flea market stalls.

The Torbay Rally is being held at the Clenon Valley Leisure Centre, Paignton, Devon. Doors open at 10am. The event features many trade stands, an RSGB Bookstall and Members service stand, a bring and buy stall and special interest displays. Refreshments will be available. For the family, some four minutes walk away, there is a boating lake, a beach, a steam railway and a flume water park.

Next the one event we know of for today, Sunday the 28th and Monday the 29th of August:

The Computer Fair 1994, which includes a Radio and Electronics Fair is being held at the Show Grounds, Aldridge, West Midlands. The showground is located just off the main A454, Aldridge to Walsall road, some 4 miles from the A5 or some 5 miles from the M6 junction 7. Doors open at 10am, or 9.30 for disabled visitors. The event features a summer spectacular with various shows, displays and other interests.

And finally, the events for tomorrow, Monday the 29th of August:

The Huntingdonshire Amateur Radio Society, Annual Bank Holiday Monday Rally and Junk Sale is to be held at St Peter's School, St Peter's Road, Huntingdon. This is a change of venue from the one published in RadCom. Trading commences at 10am, now in two halls, with car boot pitches also available adjacent to the halls. Hot and cold refreshments will be available. Talk-in will be on two metres, channel S22, or via GB3OV on 433.125MHz, RB5.

The Scarborough Radio and Electronics and Computer Fair is to be held at The Spa, South Foreshore, Scarborough, North Yorkshire. Doors open at 11am, or 10.30 for disabled visitors. The event features the usual trade stands, a bring and buy stall, Club and Group stalls and RSGB Books. Morse Tests will be available on demand, but please remember to bring two passport size photographs. Talk-in will be on two metres, channel S22.

Next the four events we know of for next weekend, Saturday the 3rd and Sunday the 4th of September:

First on Saturday the 3rd:

The Annual Wight Wireless Rally is to be held at the Wireless Museum, Arreton Manor, near Newport, Isle of Wight. The Museum is located half-way between Newport and Sandown on the A3056. Doors open at 11am. The event features the usual trade stands and a bring and buy stall.

There is no charge for admission to the Wireless Museum and the extensive gardens, but there will be a collection for the Radio Invalid and Blind Club. Refreshments will be available. Talk-in will be on two metres, channel S22. The event will be indoors if it rains. Further details from G3KPO Tel: 0983 567665.

And, for next Sunday, the 4th:

The Bristol Radio Rally which is to be held at the Brunel Centre, Temple Meads Railway Station, Bristol. Doors open at 10.30am, or at 10.15 for disabled visitors. The event features over 40 trade stands, a large bring and buy stall and an under 25 pound bring and buy stall. Refreshments will be available. Further details from G4YZR on 0275 834282.

Also the Telford Radio Rally which is to be held at the Telford Exhibition Centre, in the newer hall, Telford, Shropshire. Doors open at 10.30am. The venue has first class facilities for disabled visitors. The event features many trade stands, both large and small, an RSGB Bookstall and Enquiries stand, also many special interest group and club stands, a flea market, Novice features and a bring and buy stall. The RSGB's Morse Test will be available on demand, subject to the usual fee and the need to bring two passport size photographs. Refreshments will be available, with a sitting area. Further details from Peter, G4LSA on 0785 284388 or from John, G0GTN on 0743 249943.

And finally, the Vange Amateur Radio Society Rally which is to be held at the Laindon Community Centre, Laindon High Road, Basildon, Essex. The centre is just a few minutes walk from the British Rail Station. Doors open at 10am. The rally has the usual exhibitors. This year RSGB Morse Tests will be available on demand, remember to bring two passport-size photographs. Talk-in will be on 2 metres channel S22. For further details contact Stuart, G1VWB on 0375 859632.

CONTEST NEWS 28th August 4/13
Now for the HF contest news:

The RSGB SSB Field Day Contest takes place next weekend, from 1500 UTC on Saturday the 3rd, until 1500 on Sunday the 4th of September on 3.5 to 28MHz, excluding the WARC bands. Full details can be found in the June edition of RadCom.

The Bulgarian CW Contest takes place from 1200 on Saturday the 3rd, until 1200 on Sunday the 4th of September on 3.5 to 28MHz. See August RadCom page 18 for further details.

Next some VHF contest news:

The RSGB 10GHz Summer Cumulative Contest takes place today, Sunday the 28th from 0900 to 2100 UTC. See April's RadCom page 82 for further details.

The RSGB 144MHz Trophy and Listeners Contest takes place from 1400 UTC on Saturday the 3rd, until 1400 on Sunday the 4th. The 4th Back Packers 144MHz Contest also takes place from 1100 to 1500 UTC on Sunday the 4th of September. See January Radcom for details.

SB NEWS @ GBR < GB2RS $GB2RS280894E
SPECIAL EVENTS 28th August 5/13
Special event stations active during the coming week include:

GB6RG, operated by members of the Waterside Amateur Radio Society at the Rotary Club Gala, Applemore School Playing Field, Hythe, Hampshire on Monday the 29th on HF and VHF. Contact G1AEH on 0703 783170 for further information.

GB2HFT, will be operated, by members of the Mid Sussex Amateur Radio Society at the Hassocks Fair and Twinning Association on Saturday the 3rd on HF and VHF. Further details from Phil, G3LCF on 0444 831400.

GX0FDX, operated by members of the Central Lancs Amateur Radio Club during the Open Day and Beating the Retreat at Fulwood Barracks, Preston on Saturday the 3rd on 80 to 15 metres, excluding the WARC bands. Further details from G0FQN on 0772 423741.

TM0PDC, Pas de Calais, will be aired as part of the on-going Liberation Celebrations from Friday the 2nd until Sunday the 4th of September. TM2V will be active from Monday the 5th until Wednesday the 7th of September.
/EX
SB NEWS @ GBR < GB2RS $GB2RS280894F
SOLAR NEWS 28th August 6/13
And now the solar factual data:

The period from the 15th to the 21st of August has seen solar activity at moderate levels with several M Class solar flares. On the 14th, the largest flare of the period took place at 1738 UTC, which was rated at M3.9/1N. Further flares took place on the 15th and 17th, two on the 18th and a single flare again on the 19th. All flares erupted from sunspot region 7765. On the 14th when the group was at its largest 29 spots were reported within the group. This is the most flare prolific period for many months. The sunspot indices generally declined, giving a mean of 56 for the period. The solar flux has not varied much day to day and averaged 75 units for the period. The 90 day solar flux average on the 21st of August was 78 units.

The geomagnetic field has, in spite of the flare activity, declined from very unsettled to quiet levels, with the period averaging only an Ap index of 8 units. The state has been 'nil nothing to report' all the period. The aa indices as supplied by the British Geological Survey for the 9th to the 15th of August were relatively quiet, with the 9th being very quiet, with periods down to only 2 nanoTeslas. The average for the daily index was 31.3 nanoTeslas about K3. The X-Ray flux levels averaged A4.4 units but were declining every day from A7.1 on the 15th to A2.0 by the 21st.

I'll repeat the figures. Spots - 56; Flux - 75; Ap index - 8; X-ray flux - A4.4.

Now the ionospheric data for Central France:

Some of the missing data is now to hand but Meudon is now only sending data twice a week which means we are still behind. The F2 daytime critical frequencies at Poitiers for the 12th to the 17th of August remained reasonably steady with the period averaging 6.7MHz. The darkness hour lows averaged 2.7MHz, with periods of Blanketing E lasting up to 4 hours some days. The highs are now about 1900 hours with the lows about 0400 hours.

I'll repeat the figures. Highs - 6.7MHz; lows - 2.7MHz.

Now the ionospheric data for the north:

We still do not have any data from Ekaterinberg - it is not known why. The GEOS-6 satellite was finally closed down on the 19th August. This was one of the first satellites that monitored the solar wind and gave the cloud weather pictures for television.

And lastly the solar forecast:

This week the active side of the sun will be rotating away and solar flux levels are expected to fall to about the 75s. The geomagnetic field is expected to be just unsettled - about an Ap index of 10 units. MUFs during daylight in the south are expected to be about 20MHz, and the darkness hours about 11MHz. The best paths are expected to be north/south.

And that's the end of the solar information.

/EX

: this?

Phone patches on Amateur Radio repeaters are for the convenience of
persons that allready have an amateur license.
The patch is for contacting family and friends AND summoning assistance
when needed.
No business calls allowed.

If really interested in amateur radio then drop by local Radio Shack Store
or your library and pick up the books on "Amateur Radio".

: I hate the memory effect of NiCd accus ...

Are you sure you really want NiMH's? My experience with them in a Toshiba Laptop have been extremely disappointing. You may hear of reduced shelf life with them. *Extremely* reduced is more like it. Within 24 hours, mine seem to be down at least 50%, and after several days, they're essentially flat. They also seem even more susceptable to heat than NiCd. A couple of hours in the back seat of my car (in a carrier bag) on a warm day, and both of my recently charged packs were stone dead.

Note: these are, obviously, just impressions based on about 8 months of usage with two packs. I've not made any attempt to scientifically measure the differences. I do know that given my use model for my HT, I'd be *extremely* reluctant to go to NiMH technology batteries. Environmentally friendly they may be, but that still doesn't make them useful.

Sometime in an earlier life, I heard that QST was the morse way to say
"go over to phone", in other words, now that our cw traffic is complete,
let's talk. It must be false, as no one else has mentioned it.

I would like information on any open repeaters in the Delaware Valley
that are operating in the 440MHz band. If they are operating on
sub-audible tones, I would like to know the frequency. Also the
general location of the repeater. And information would be greatly
appreciated.

DX Bulletin 53 ARLD053
From ARRL Headquarters
Newington CT August 26, 1994
To all radio amateurs

SB DX ARL ARLD053
ARLD053 DX news

The items in this week's bulletin are courtesy of Jim, AD1C, Doc, K0HTF, Len, W7MCU, Bob, W5KNE, the QRZ DX bulletin, Chod, VP2ML, The DX Bulletin and the Yankee Clipper Contest Club PacketCluster network. Thanks.

THAILAND. Fred, K3ZO, is in Thailand until October 10 and will be signing HZ0ZAR. Check 20 meters between 1130 and 1400z. He plans to give 40 meters a try for stateside Qs. Sunrise in Bangkok is at 2307z and sunset at 1119z. Plans also call for a trip to Singapore to attend the IARU Region 3 Conference there. QSL via K3ZO.

NEPAL. Kyoko, NH6RT, is active as 9N1KY. Check 14184 kHz at 1648z and 14270 at 1700. QSL via Kyoko Yamakami, Box 3, Tokaimura, 319-11, Japan.

RWANDA. Both VE3MJQ and PA3DZN should be active any day now from Kigali. In the meantime, try working 9X5/F5PGP on 14195 kHz at about 2030z.

MONGOLIA. Members of the Japan UNICEF Ham Club should be on the air as JU1HC through the end of the month. There have been no PacketCluster spots for this one in New England as we approach bulletin time. However, try JT1KAA on 14021 kHz around 0210z.

UGANDA. Paul, WF5T, plans to return to Uganda and operate as 5X1XT, concentrating on CW and RTTY. QSL via his home call.

CHAGOS. Pete, VQ9TP, aka N5TP, has been busy on his favorite mode, CW. Check 18083 kHz from 1345 to 1600z. Pete operates almost exclusively between the hours of 1230 and 1630z. Tom, VQ9TT, has been worked on 14014 kHz at 1300z.

CHINA. Len, W7MCU, called ARRL Hq recently to report that BY1QH is back on Oscar 13. QSL via the 1994 CBA.

ARUBA. Contest station P40W will be rebuilt at a new location just prior to the CQWW SSB contest in October. John, W2GD, will be doing both the rebuilding and operating.

3168. Clubs in SF Peninsula Area?

Newsgroup: rec.radio.amateur.misc
Date: 1994-08-25 22:47:45 UTC
From: kgaugler@systems.DHL.COM
Message-ID: <Cv44qH.9qK@ssf-sys.DHL.COM>
Source record: 261120

Can any one provide me info including contact person(s) for ham radio clubs in the San Francisco Peninsula area? I am in Burlingame and looking for clubs that have a decent repeater and are active in public service events. I used to belong to the Mt. Diablo ARC but I cannot dependably get into their machines now from this side of the bay.....

Thank You in advance for your help!
-N6OSK

3169. PK232 software? Where?

Newsgroup: rec.radio.amateur.misc
Date: 1994-08-25 22:54:05 UTC
From: robert@steffi.demon.co.uk
Message-ID: <ROBERT.94Aug25235405@steffi.demon.co.uk>
Source record: 261034

Where can I get software (particularly) fax/PC oriented for the PK232
unit by AEA?

BTW: Is this still a respected/useful unit? It certainly was 10 years
ago :-)

cantrell-

Yes, they do. Perhaps the R/S 800 parts ordering number would be easier to deal with?

I got my callsign after 5 days. That as far as I know is a record for the UK.
Average in the UK is just over 1 Month.

3172. Re: FT530 breaks squelch when it shouldn't

Newsgroup: rec.radio.amateur.misc
Date: 1994-08-25 23:20:17 UTC
From: hemstree@cs.colostate.edu
Message-ID: <hemstree-2508941720170001@slip8.cs.colostate.edu>
Source record: 261121

I have a couple of friends who own Yaesu FT-530's. They have the opposite problem. When I try and talk to them with an AZDEN PCS-4000, the squelch will occasionally not break even though they show a full strength signal on their s-meter. A chat with one of Yaesu folk at a Ham Fest resulted in a "oh, the azden bug". Go figure. It's really a nice radio other than having to repeat myself often whenever I am talking to them. One of them has finally resorted to listening to me on the scanner and talking on the FT-530.

Good luck,
Charles

SUBJ: IPS DAILY SOLAR AND GEOPHYSICAL REPORT
ISSUED AT 25/2330Z AUGUST 1994 BY IPS RADIO AND SPACE SERVICES
FROM THE REGIONAL WARNING CENTRE (RWC), SYDNEY.
SUMMARY FOR 25 AUGUST AND FORECAST FOR 26 AUGUST - 28 AUGUST

1A. SOLAR SUMMARY
Activity: very low

Flares: none.

Observed 10.7 cm flux/Equivalent Sunspot Number : 71/6

GOES satellite data for 24 Aug
Daily Proton Fluence >1 MeV: 3.6E+05
Daily Proton Fluence >10 MeV: 1.3E+04
Daily Electron Fluence >2 MeV: 3.8E+06
X-ray background: A1.1
Fluence (flux accumulation over 24hrs)/ cm2-ster-day.

1B. SOLAR FORECAST
26 Aug 27 Aug 28 Aug
Activity Very low Very low Very low
Fadeouts None expected None expected None expected

Forecast 10.7 cm flux/Equivalent Sunspot Number for 26 Aug: 70/5

2A. MAGNETIC SUMMARY
Geomagnetic field at Learmonth: quiet to unsettled

Estimated Indices : A K Observed A Index 24 Aug
Learmonth 10 2323 3222
Fredericksburg 15 5
Planetary 12 5

Observed Kp for 24 Aug: 2211 1222
2B. MAGNETIC FORECAST
DATE Ap CONDITIONS
26 Aug 10 Quiet
27 Aug 10 Quiet
28 Aug 10 Quiet

3A. GLOBAL HF PROPAGATION SUMMARY
LATITUDE BAND
DATE LOW MIDDLE HIGH

25 Aug normal normal fair
PCA Event : None.

3B. GLOBAL HF PROPAGATION FORECAST
LATITUDE BAND
DATE LOW MIDDLE HIGH
26 Aug normal normal normal
27 Aug normal normal normal
28 Aug normal normal normal

4A. AUSTRALIAN REGION IONOSPHERIC SUMMARY
Observed
DATE T-index MUFs at Sydney
25 Aug 26 Near predicted monthly values with 15-30%
enhancements 14-20 UT. Sporadic E was
observed 02-05 UT and 13-18 UT.

Predicted Monthly T-index for August: 20

4B. AUSTRALIAN REGION IONOSPHERIC FORECAST
DATE T-index MUFs
26 Aug 20 Near predicted monthly values
27 Aug 25 Near predicted monthly values
28 Aug 25 Near predicted monthly values
COMMENT: Spread F and sporadic E may degrade F layer communications
at times.

> > I have a Cushcraft R7 antenna. It has never been satisfactory. It resonates
> > on some bands and not on others.

I helped a pal assemble, adjust and mount and R7. After one particularly stinging RF burn on the ear (a radial hit me in the ear while I was holdin the antenna mast) we got the antenna working. Excellent little piece of metal! It outperformed his nifty little wire dipole like no tomorrow and this from a vertical!

> Some tips (might seem ridiculous, but...)

> Check the matching unit (the big black box).

I agree. Most of this was covered in the installation and assembly/adjustment instructions.

3179. Shuttle Freqs

Newsgroup: rec.radio.amateur.misc
Date: 1994-08-26 02:24:00 UTC
From: clint.bradford@ectech.com
Message-ID: <9408261011431132@ectech.com>
Source record: 261060

A>Was wondering if anyone knows the frequencies that the shuttle uses for
>communications to earth or for other uses.

There have been many requests for "where do I find the audio for the Shuttle" on the forum. As mentioned earlier, the Goddard Amateur Radio Club (Greenbelt, MD) re-transmits the audio on a number of HF frequencies, and a number of Amateur Radio repeaters throughout North America also place the Shuttle audio on their output. This system is called "NASA Select Audio", and is usually pulled from a satellite feed or other direct method. This service is available on non-DoD missions. On some launches a video feed is also available, which is then made available on some ATV (Amateur Television) repeaters.

I have summarized those feeds that I know about below, I would encourage you to let me know of any additions or changes that you know about. Keep in mind the list will change as repeaters add or drop the audio. Also, the audio will be present only when there is activity, which is not constant, especially at night. At other times you will probably hear other Hams chatting.

Greater than 2 MeV Electron Fluence for 25 AUG is: 2.7E+06

SYNOPSIS OF ACTIVITY

Solar activity was very low. Region 7770 (S08E12) is the
one spotted region visible. The limbs were also quiet.

Solar activity forecast: solar activity is expected to be
very low.

The geomagnetic field was at quiet to active levels.
Substorms occurred during local nighttimes.

Geophysical activity forecast: the geomagnetic field is
expected to be mostly unsettled the next 3 days.

Event probabilities 26 aug-28 aug

Class M 01/01/01
Class X 01/01/01
Proton 01/01/01
PCAF Green

Geomagnetic activity probabilities 26 aug-28 aug

A. Middle Latitudes
Active 25/25/20
Minor Storm 10/10/10
Major-Severe Storm 05/05/05

B. High Latitudes
Active 30/30/25
Minor Storm 15/15/15
Major-Severe Storm 05/05/05

HF propagation conditions were normal over all regions.
No changes are expected over the next 3 days, through 28 August
inclusive. Near-normal conditions will continue.

NO EVENTS OBSERVED.

NOTES:
All times are in Universal Time (UT). Characters preceding begin, max,
and end times are defined as: B = Before, U = Uncertain, A = After.
All times associated with x-ray flares (ex. flares which produce
associated x-ray bursts) refer to the begin, max, and end times of the
x-rays. Flares which are not associated with x-ray signatures use the
optical observations to determine the begin, max, and end times.

Acronyms used to identify sweeps and optical phenomena include:

II = Type II Sweep Frequency Event
III = Type III Sweep
IV = Type IV Sweep
V = Type V Sweep
Continuum = Continuum Radio Event
Loop = Loop Prominence System,
Spray = Limb Spray,
Surge = Bright Limb Surge,
EPL = Eruptive Prominence on the Limb.

Can anyone give me info about the Motorola HT 1000. I just bought one
from a local business that was going under, and got a great deal on it.
How can I get it re-programmed for the freqs that I want???? It seems
to be a fine little radio and I would love to use it. Any and all help
would be greatly appreciated!!! Oh and yes I am a licensed amateur radio
operator.

I have had my LB quad up for almost a year now....the 10, 12, 15, 17, 20 model... and
just love it. Mine is up about 35 feet at the boom. Have done some rather unscientific
comparisons with the 3 el yagi down the street at 45 ft.. I hear signals earlier then
he does nd keep them later in the evening.. Excellent construction...
NO I don't work for Lightning Bolt.... just a very, very satisfied customer.

PS.... with the auto tuner on my FT-990 I can use the quad on 30 and 40 also....
I would not count on this although... I probably just stumbled into the right
length of feedline, etc.

>wah-lah...works like a champ.
>
Rip off Shack (Radio ShacK) also has a cassette adapter that fits into
a cassette player and the other end plugs into an audio source such
as a CD-ROM player. I've taken one of these, change the plug that
goes to the CD-ROM to two separate (single) inputs like you would
find on a HT earphone jack. then you can run two radios at the
same time thru the car's stereo system (I have 2Mtrs on the left
channel and 1.25 Mtrs on the right). Big difference.

3184. ARLB069 FCC call sign update

>Of course, I don't miss the intermod and overloading wide-band receivers are somewhat
>prone to.

Yup, in fact they even do quite well hooked up to an outside antenna in a strong-signal area. I live 2 miles from a major paging/cellphone/broadcast /public service radio site. An FM station is barely audible on one of our telephones. My scanner, on another outside antenna, is hammered on UHF - the signals come and go as the junk comes booming in, drowning them out. For 2m, I rigged up a simple 2m 1/4 wave groundplane up about 25' on the chimney. An IC2AT hooked up to this was nearly useless - the other station would disappear into the noise every time some paging transmitter fired up. The HTX202 rejects all of that, and is a useful base-station radio. It even puts out 7ish watts when hooked up to a gel-cell. Rat Shack done good.

-Tom R. N1OOQ randolph#est.enet.dec.com

3192. FCC Computers still down

Newsgroup: rec.radio.amateur.misc
Date: 1994-08-26 13:04:05 UTC
From: kgk@nwu.edu
Message-ID: <kgk-2608940806220001@kgkmac.repoc.nwu.edu>
Source record: 261055

Just some info for you. I called the FCC today and got the taped message that the computers were down. Someone posted they were down yesterday.

According to the person I spoke to, they will be down on Aug 25 & 26 and back online on the 29th. Apparently they were useing two systems. Part of the new and the old, with two seperate databases. The are putting all information on the new system into one database.

Hope this speeds things along. So don't bother to call them today as they cannot tell you any useful information at all until the system is back online Monday.

Regards
Ken

Peter,

If i agreed with you any more i would seek psychoanalysis! Finding
useful info about amateur radio is becoming a full time job around here.
After wading through the gripe after endless gripe, and who did not
like what peice of gear, i feel that much time is wasted. If the
super pole 2000 with no-touch remote tuner doesn't work as expected,
do something crazy, like BUILD something better and cheaper.

I fully support rec.radio.amateur.whining, thus eliminating "cross posting"
of verbal flatulence to technical groups.

Likewise, I have had mine for about two years and am quite happy
with it. Good materials, easy to construct and put up, no soldering.
Imported mine to the UK on the recommendation of a ham in PA
during a Stateside QSO.
Nice to be able to build the thing in two halves and fit each on
close to the tower, also just having to use a PL259 to the balun was
again child's play. I have the 5-bander.

For Sale,

My YUPITERU MVT 7100 scanner
I want to have 900 dutch guilders for it.

Some specifications:

530kHz-1650MHz
1000 memory channels
wfm,nfm,am,lsb,usb
Steps 50Hz, 100 Hz, 1kHz, 5kHz, 6.25 kHz, 9kHz, 10 kHz, 12.5 kHz, 20 kHz
25kHz, 50kHz, 100kHz.
Scanspeed: 30 channels/sec
weight: 320 grams
size: 64,4x155x38.2 mm

It is a portable scanner, with nicad bateries, and charger (you can use
the scanner while charging)

Interested mail me

Donar Alofs

donar@cs.vu.nl or donar@nijenrode.nl

This machine is THE BEST on the portable market today!

3198. Re: PLSE INCLUDE SASE FOR DIRECT DX QSL CARDS!!!

Newsgroup: rec.radio.amateur.misc
Date: 1994-08-26 14:13:13 UTC
From: tigger@prairienet.org
Message-ID: <33kt9p$f6s@vixen.cso.uiuc.edu>
Source record: 261044

After seeing Sharon's post on no SASE's for QSL's I wanted to add
my two cents' worth.

I recently went on a trip to 6Y. I worked the CW WW WPX
CW contest as 6Y7M. This was the first time the 6Y7 prefix was
activated. While 6Y is not a rare country, I've still received
hundreds of cards. Many cards included an SASE, and an occasional
envelope included a $1 plus an SASE. For this I'm very
appreciative.
The way I handled my cards is: Those who sent me an SASE,
or some form of return postage, got sent out right away. Those that
didn't sat in the bin until I got around to going to the post
office to mail them. On those that sent no postage, I put a
simple note on the cards: "S.A.S.E. next time, okay? Tnx."

I am a contester/DX'er. That is how I enjoy this multi-faceted
hobby. Since this is how I enjoy this hobby, I make thousands
of QSO's per year. I'll QSL every one of 'em, but those that
want/need my card for whatever award usually send an SASE. If
they don't, well, they'll have to wait a while. I'm not trying
to punish them, it just comes down to the fact that 1) I'm just
out of college with a low-paying job, and food/rent are more
important than QSL'ing, and 2) I'm very busy, and what little
free time I have I would rather spend with my girlgriend or on
the air than filling out QSL's. I understand that there is an
obligation for getting the cards out in a reasonably timely
fashion, and I do my best to fulfill that obligation.

My advice (for what it's worth): If you have a QSO with ANY
station, DX or otherwise, and you REALLY, REALLY want that
card, send an SASE. It shows the operator that you're SERIOUS
about his card, and they will accomodate you faster than if
you don't send an SASE. My return rates for my outgoing QSL
requests skyrocketed whjen I started including SASE's in my
QSL requests for various awards I was/am pursuing.

This commentary deals with my direct requests... haven't been
hit with the bureau onslaught yet.

73 & DX to all.

cantrell@sparky1.aero.org (John Cantrell) wants to know:

>Does anyone know if Radio Shack publishes a service
>manual for the HTX-100 10 meter xceiver?

Radio Shack's National Parts wharehouse in Fort Worth is reachable at
(800) 442-2425.

You should be able to order the HTX-100 service manual by ordering
part number "19-1101 SM", if they still have them in stock.

Message-ID: <2E5DA863@smtp>
Source record: 261046

I joined the ham section of internet to learn about ham radio and be in touch with people who may be able to help me, or exchange information with me on ham subjects. We all have out own stories to tell, dont we?

Well, I am getting dismayed with all the items about how expensive amateur radio in the US. Radio Shack called Rip-Off Shack? Icom service costs?

What the hell is the matter with you? Want ham radios free? What do you think the chips in them radios cost? Nothing.

Hell, a Kenwood TS50S costs $1700 in Europe. You can buy it for less than $1000 in the US. A call for three minutes to a manufacturer costs an average of $20 here. Shipping, dont even ask. And you americans complain?

Remember that amateur radio manufacurers arent in ham radio for major league profit. Icom sells marine radios for two to three times the price of 2 meter radios (marine radio is much simpler). Kenwood the same and so is Yaesu. They make their money in these so-called commercial rigs.

Granted there are exceptions. AEA, as far as I am concerned overcharges. The cost of the bits and pieces of the PK-232 was calculated at $56.75. They sell it for $320!!!!!! Thats ridiculous. I am sure there are others like that.

However, on the whole, we are associated with an industry where profit is not the word you hear often. Look in the pages of QST? How many little companies are there trying to offer products for our use. Thousands. No other industry sector can offer that, not even computers.

When I started in the Computer business in 1975, the intel 8080 was just coming out. The microcomputer industry was just starting. Little companies run and owned by dedicated individuals started offering products. Not for profit but because they believed their product was better than the competition's. By 1990, little companies dissappeared from view in the PC industry. Amateur radio still has them, and they will be around for ever.

We should feel happy we live in an industry not run by profit but quality, choice and adventure. It has been like this for years and will be like this by the year 3000 (assuming the FCC allows it).

So if you want to complain about prices, if you are being overcharged, start a forum called "rip-off' and upload messages there, not here.

Source record: 261058

If I read the original question correctly, you want to know if W6RO
is still in operation and how to operate there. I know that W6RO
is still operating on the Queen Mary as late as yesterday. I
operated there a few times last year. The Queen was sold, I understand,
but the W6RO boys made the right arrangements to keep the station
going on board.

I believe that there is a photo and some info about how to operate
on the Queen Mary in this months QST. If you cannot find it, let
me know and I can post the info here.

Well, a vertical is much better for transmitting than receiving.
It has a low angle of radiation for transmitting, but the same pattern
also results in picking up a lot of local QRM.

The Beverage is an antenna designed to be nonresonant, with a high-Z
output, effectively. I suppose you could rig up a matching network
to transmit from one, but it wouldn't be worth the trouble.

Message-ID: <199408262128.OAA18107@ucsd.edu>
Source record: 261075

A CW hint that worked for me: I frequently start with a dit-dah for the
letter 'C' rather than dah-dit. My thumb which operates the dit side of
the paddle closes the contact first by mistake. Of couse, this is no good.

Solution: I adjusted the contact spacing. I had kept them spaced evenly. Now
I make the contacts closer on the dah side than the dit side.
This helps reduce my prejudice to the thumb. Someone else might
have a similar problem. The point being, equal spacing of the
paddle contacts may not always be the way to go.

I need a user manual for the Cushman Spectrum 6000 Radio System Analyser.
Can anyone provide either the Fax (or e-mail) number of Cushman, or a
xeroxed (photo-copied?) copy?

Please e-mail replies to the Reply-To: listed above.

Thanks in advance.

WA2JGJ writes:

When I was there several years ago (1992), all you had to do was find the "Radio" room. As I recall, the current radio room is not the same as the room used when the QM was actually in service. The current room was located a deck below and just aft of the bridge (if memory serve me correctly).

I also read that the QM was closed (or at least Disney, which ran the QM exhibit) and the attraction was closed. But I may not have my facts straight.

Disney did indeed bail out from managing the QM for the City of Long Beach (who actually own her I believe). The Queen has since been reopened with free admission for the self guided tours (much like the original arrangement) and restaurants and the hotel as revenue sources. The radio room is only open part time, I believe during peak tourist times. It was closed last time I was aboard. A call to the Queen Mary (don't have the number, area code is 310) may help with determining the actual operating schedule. Licenses amateurs may operate the station, bring your license.

You can transmit on a beverage but the gound losses are awful.
From the ARRL antenna book.
"The Beverage acts like a long transmission line with one lossy conductor
(the earth), & one good conductor (the wire). Beverages have excelent
directivity if erected properly, but they are quit inefficient. Therefore
not suitable for transmiting".

I have uploaded to the SimTel Software Repository (available by anonymous ftp from the primary mirror site OAK.Oakland.Edu and its mirrors):

SimTel/msdos/info/
pcfans.zip Network survey & summaries of keeping PCs cool

PCFANS.ZIP is an 85+ response survey about PC fan designs and success or failure at keeping one's PC cool. Respondent messages and two summaries (one technical and one highlighting network ops) are included. All solicitations and collection were done over the Amateur packet radio network and the study gives an interesting numerical analysis of network response time.

Nice ideas re piping the mobile's audio into the car stereo's system via the CD port. The problem is that you can't be monitoring the mobile while listening to the car's radio.

Anyway you can merge the two without degrading the already marginal car stereo system? (i.e. can't hijack one of the speakers...)

Greg.

The beverage will work in transmit, it has a variable effeciency
depending on length, and frequency you are working. A good tuner
with high voltage parts will do for matching it for most cases.

But a low angle radiating vertical and a beverage receive
antenna is a better choice. You will put out a bigger signal
and likely hear more as well.

Anything you can load into will transmit something...even
a dummy load transmits.

ARLP035 Propagation de KT7H

Solar activity remains very low. Solar flux was almost ten points
lower last week compared to the week before. The short term outlook
is for activity to stay fairly flat, with the flux to rise to around
80 between September 4 through 9. Active geomagnetic conditions due
to a recurring coronal hole are expected around September 6 to 12.

Sunspot Numbers from August 18 through 24 were 62, 65, 58, 40, 12,
38 and 50, with a mean of 46.4. 10.7 cm flux was 77.4, 75.3, 72.3,
71.1, 70.6, 71.9 and 71.9, with a mean of 72.9.

I sent my check into the ARRL for a sub to QST but
never received even a single issue (they, however, did
cashed the check promptly).

I next wrote a lettter to ARRL HQ asking about my sub
but I received no reply after several months.

Is there a specific person in charge of subs to
QST at ARRL HQ? What is their address, phone, fax, e-mail #?

I would use the masthead of QST to get this info, but I don't
seem to have one around. :-)

Does this happen frequently?

3218. TM-733A.DOC

Newsgroup: rec.radio.amateur.misc
Date: 1994-08-26 22:42:00 UTC
From: st3qi@elroy.uh.edu
Message-ID: <26AUG199417420905@elroy.uh.edu>
Source record: 261072

Modifications, Undocumented Features, and Bugs for the Kenwood TM-733A.
August 22, 1994. Release 1.1

This document is a compilation of Internet messages from
Steve Haehnichen KD6RLY and Brad Killebrew N5LJV, edited by Brad Killebrew.

Extended RF Modifications

Remove power source from the radio.

Remove the display panel.

Remove the top cover the radio.

Face the front of the radio away from you.

Remove the speaker.

Looking from the back of the radio, the control board is vertically
mounted just behind the front panel wall (which can be removed easily
if better access is needed.)

Just to the right of a chip labeled XRU4066BCF and just to the left of
two green wires (B2 & B3 which are draped over the board to the rear) are
two zero-ohm SMT resistors, B0 and B1, marked "000".

Remove B0. (the one on the left - furthest from the green wires)

Taking it out might be a bit tricky. It's glued down for surface-mount
assembly. Be careful not to pull the trace from the board.

Perform a CPU reset by holding [MR] while turning on the radio. It
will then ask if it is "OK?" to reset, press [MR] again.

The ranges after modification are as follows:

Tx: 136-174 410-470
Rx: 118-174 300-470

The cellular band is indeed missing.

Removing Jumper 1 (B2) ONLY is the MARS/CAP modification. (The green
wire on the left).

DTFM Remote via Microphone

The TM-733 is fully DTMF remotable via the microphone (documented). The radio can also be externally DTMF controllable with an HT, but that will be described later.

The DTMF control keys are exactly as shown on page 81 of the manual. Note that the microphone is active all the time, so any ambient DTMF tones near your mic will also change rig settings. This includes tones coming in on the other band and out the speaker.

Cross Band Repeating

Cross band repeat isn't documented but comes ready from the factory. To enable cross band repeat from the front panel, first select a band by pressing BAND SELECT. Then, change the control to the other band by hitting [CONT SEL]. Next, press [F] for one second, then the "X" button (far right side). Decimals will appear between the Kilohertz digits, and the "ON" indicator will light momentarily. The microphone sequence to enable cross band repeat while in remote control mode is "DC".

The transmitter hang time can be toggled between 500ms to 0ms by turning on the radio with [LOW] pressed. They also recommend enabling the Time-out Timer, for obvious reasons.

DTMF Paging and Squelch

The DTMF Paging & DTMF Squelch protocol (AAA*BBB) is compatible with the Yaesu 530 and all Kenwood radios supporting this.

DTMF Monitor

There are some serious bugs in the "DTMF Monitor" feature (Page 63: [PTT] + [DWN] + Power On). This feature supposedly lets you hear the DTMF tones you are transmitting. The first problem is that it only gives you a short tone from the internal speaker. This is not true to the transmitted tone that lasts as long as you hold the key. The much bigger problem is that it mixes the desired tone and the feedback tone resulting in an almost indecodable DTMF tone. Kenwood is aware of this bug.

Front Panel

There are two undocumented icons on the display; one is the "heart" symbol. Anyone know what that's for? It could just be a spare. I noticed they used the odd "spade" symbol to indicate AM receive, so maybe these were last minute extras. Dunno..

From looking at the schematic, it seems that the only programmable memory is physically located in the detachable front-panel. I think

this means that if I use my front-panel on someone else's radio, I get all my memories and settings. Anyone try this?

The whole front panel is connected to the rig by four wires (yep, including the volume/squelch pots.) According to the schematic, these are: power, ground, data in, and data out. I'm wondering how hard it would be to make a PC interface for this thing and replace the whole display and controls with a full-screen version. It wouldn't surprise me if many of the programming limits were also imposed by the front panel, and not the unit.

Wireless Cloning

The advertised but undocumented Wireless Clone function is described in App Note AAN-0008 which they will mail out on request. (Maybe if enough people ask for it, they will include all the functions in future instruction manuals.) In summary:

- Prepare the two radios for simplex operation on the same frequency.
- Turn both radios off
- Press [CALL]+[SHIFT] + [Pwr On].
- This should place the radios is clone mode with "CLonE" on the display.
- Press PTT on the "Master" radio momentarily. This will start sending the programming DTMF tones.
- After all data has been transferred, the display of all radios will read "End", indicating success.
- If the signal is interrupted or corrupted, the "Slave" displays will read "Err". Turn them off and try again.

Notes:

- Both the Master and Slave radios must have the same number of memory channels available for each band. Example: You can not clone a stock Master to a Slave with ME-1 memory expansion.
- You can not clone between different Kenwood radio models, even if they seem identical.

Be careful when using the clone feature. It has been known to wipe out or scramble memories on the master radio during or right after clone.

Bugs and Problems

To date, I have logged two trouble reports with Kenwood.

The first is the well-known (but still denied) problem with the transmitted PL (CTCSS) tone. The tones are filthy. They contain many harmonics and synthesis noise. I'm guessing this is because they are using 7-bits from the CPU and a resistor net (DAC) to synthesize the tone. The sound/intensity of the noise depends on the actual

frequency being generated. (The PL tones also come out of the radio's speaker while transmitting. Weird, but not a problem.)

The PL noise seems most messed up (on my radio) at 107.2 Hz, where the noise beats with the tone. Go simplex and ask someone to describe the noise to you, or listen carefully to your own speaker while transmitting. Some repeaters do a better job than others of hiding the noise for you.

Kenwood's response to this complaint seems to vary depending on who you talk to. One tech (I wish I would have got his name!) acknowledges the problem, and says they are working on a fix. He guessed that it involves changing a resistor. This would imply (to me), that they are simply turning the PL deviation (strength) down a bit to hide the noise. Unfortunately, this may make the PL less reliable for getting into repeaters. This is not an acceptable fix for me, so I'm insisting that they describe the modification to me before I send the radio in for repair. So far, no luck.

Other representatives will deny that they have heard of the problem. I don't know the cause of this, because it's a well-known and frequently discussed problem among local hams.

The Service Manual specifies a test for the PL. The technician is simply required to verify that any one PL tone is between 500 and 1500 Hz deviation. This is quite a wide tolerance range! The "standard" PL tone deviation should be 750 Hz. Twice that strong might be too strong and become audible. There are no trim-pots on the PL deviation, so I'm guessing that the deviation is pretty constant from radio to radio.

The other problem concerns the DTMF Confirmation Tones. This feature is off by default (I wonder why :), while it seems pretty useful. To turn it on, press [PTT] + [Down] on the microphone while powering the radio on. This will generate short DTMF confirmation tones whenever you send DTMF over the air from the keypad. Unfortunately, it mangles the beginning of the outgoing DTMF tone! This is serious enough that most local repeaters can't detect the tone, or count it as two tones.

Get a receiver and listen to what you are sending out when the Confirmation tones are enabled. It sounds to me like they may be mixing the confirmation tone in with the real tone and getting some destructive interference. Just a guess, though.

I called a Kenwood technician (Ricardo) and worked with him on the phone to reproduce the problem there. So, as of today, this is a Known Problem, and they are looking into a fix. :-)

I am really curious to know what they would say if other folks called up and complained about this problem. Would they deny hearing about it, or would it really be a Known Problem? Might give some insight into the PL-noise denial thing anyway. :-)

Personally, I'm much more concerned about the noisy PL than the DTMF confirmation tones, since I can just shut those off and pretend that feature doesn't exist. If enough people call about the PL problem, maybe they will come out with a real fix and offer it under warranty to all the radios out there (since they're all pretty new). My guess is that it will involve a free TSU-8 tone decode module, but don't hold your breath. :-)

Check your PL, and if it bothers you, call them! Their support number is: 1-310-639-7140, and you press [2] at their voice menu to get to the Amateur Radio department (8:30AM - 5:00PM PDT). So far, they have been fairly knowledgeable and responsive, and they always call back the same day if they're busy or stumped. I just wish they would offer a real fix.

External DTMF Remote Control

The following procedure places the 733 in External DTMF Remote Control.

Note that this mode is different then DTMF Remote Mode. This mode concerns the control of the 733 with an HT, and not the microphone.

- Press Band Select and select the UHF band.
- Pick a UHF control frequency.
- Turn on the UHF DTSS function and select a tone sequence. (p. 89)
- Turn the UHF DTSS function back off.
- Press Band Select to move to the VHF band.
- Press [CONT SEL] to move control back to the UHF band.
- Turn OFF the radio, press and hold [CONT SEL] while turning the radio back on, then release [CONT SEL]. The S-meter scale and the DT indicators for the UHF band will begin flashing. The LOCK indicator will turn ON, and most front-panel keys (except PWR) will be disabled.
- To begin remote control, you should key the external radio and press the following key sequence: "Axxx#" where "xxx" is the preset DTSS code selected earlier.
- If the proper code is received by the 733, the beeper will sound and the DT indicator will stop flashing. The radio can now be remotely controlled using the function chart below.
- To return to standby mode, press "A#" on the remote radio.
- To return the radio to normal operation, turn the radio off, then press and hold [CONT SEL] while turning the radio back on.

Refer to this chart when using the TM-733 in "External DTMF Control".

1 2 3 A
T.ALT ON TONE ON CTCSS ON ENTER

4 5 6 B
T.ALT OFF TONE OFF CTCSS OFF TONE SEL

7 8 9 C
CALL VFO MEMORY REPEATER ON

* 0 # D
DOWN POWER LEVEL UP REPEATER OFF

There are no "shifted" functions. Just one function per button.
After you hit "B" for TONE SELECT, press * or # to go up or down,
and same is true when in VFO mode or in MEMORY mode.
Tones 7, 8, and 9 mimic the three buttons at the top of the 733 mic.

Pressing "C" places the radio in cross band repeat mode. You will
recognize this because the of the dots between Kilohertz digits.
After pressing "C", put the radio back into standby mode with "A#".
The 733 will now cross band repeat. To disable cross band repeat, place
the radio back into the External DTMF Remote Control with "Axxx#".
If you can read through the lines, the 733 is capable of operating
as a frequency agile remote base. Now Kenwood just needs a CW IDer.

Assembly Mode Test

In the TM-733 Service Manual, it describes a test mode that I haven't
seen mentioned anywhere else. So, here's the scoop:

Entering Assembly Mode: [CALL] + [MUTE] + [Power On]
All LCD segments should come on. (To exit, power off.)

Press the [VFO] key. *This must always be done first*
The serial port is checked and "F" with "80" on the display indicates
test passed. "1" or "2" means failure.

Different keys now show different displays, with [LOW], [SHIFT],
[TONE], and [REV] also adjusting the backlight intensity.

Set the dials to minimum, then press the [MR] key. Each of the dials
shows the digitized level.

This looks useful for checking all the keys and dials when you suspect
a bad connection.

Radio Versions & Freq. Ranges

Out of curiosity, I've been trying to figure out how other variants of
the Kenwood TM-733A can be easily "mutated" from the American "K"
version.

Here's what I've come up with so far. I'm curious to know if anyone
else has tinkered with this stuff. I figure since the radio is so
new, every one out there is still under warranty, so there probably
aren't many folks poking about with a soldering iron...

The K and P (Canadian) models seem physically identical so far. Only
the warranty card has a different part number. Is there anything else
I've missed?

The M2, M3, M4, and E2 models have the most liberal Tx frequency ranges: 136-174 & 410-470 MHz, instead of the US ("K") version's: 144-148 & 438-450.

The K version already has the widest 2m/70cm Rx range possible: 118-174 & 410-470, so there won't be any mods there.

The K and P models are lacking significant hunks of the 800 MHz Rx circuitry. In addition to some caps and inductors to link in the 800 MHz font end, IC202 is completely missing (the chip with "80R" output). I think it's a custom chip, so there's not much chance of finding one. ALL models other than K and P have this chip. If you're really desperate to get the 800 MHz Forbidden Band, you'll have to buy another radio, or try to order the chip from Kenwood Parts.

Also, K and P models have a "KCB20" for IC209 instead of KCB14. This is the "430 MHz Transmit Drive" chip. I think K is optimized for ~445 while the other is centered at ~435, but I'm guessing. The test/calibration instructions use different test frequencies for the two models, so there is probably some difference in the specs.

As for the CPU, it seems to detect which model it's in by reading pins 90 through 93 on power-up. (These are output lines to the DTMF encoder after power-up.) The pins are selectively pulled hi/low by wires and resistors to set the model.

If anyone knows how to override this setting by front-panel (software) controls, I'd be very interested to hear it!

As for hardware configuration, here's the info:

There are two wires (W1, W2) installed on the CPU board that apparently bypass resistors, tying the lines hi via 10k ohms (CP402 Rpack) instead of low via 100k resistors (CP403 Rpack). There are also three zero-ohm resistors that do something similar.
For those of you following along at home, that does indeed make five select lines, with only four going into the DTMF chip. :) I'm not sure about the fifth one, R413. It goes lots of places, including several dispersed pins on the CPU. It's only installed on the M4 (Chinese) model of the radio. Since the M4 model also uses a Chinese front-panel display, this line probably selects different glyphs and such. It's also tied into the descriptionless pin 77 of the CPU, called "RPT" (cross-band repeat?). Maybe they can't sell cross-banders in China.

The other four: W1/R410, W2/R411, R412, and R414 are the selectors that pull on the DTMF data lines. If we ignore the M4 and E models (which have more unique components), the K and M2/3 models have only these differences:

W1,2 R414
K,P Yes Yes
M2/3 No No

I'd bet one of those accounts for the different Tx range limits on the
CPU. Maybe the other allows for 800 MHz frequency tuning.

3219. Re: Internet gateway to packet radio in W

Newsgroup: rec.radio.amateur.misc
Date: 1994-08-26 22:51:43 UTC
From: slay@netcom.com
Message-ID: <slayCv5zI8.3pB@netcom.com>
Source record: 261070

If you are interested in using the N0ARY packet/internet gateway; or if
you simply want to access his bbs remotely via internet, here are the proper
addresses:

gateway_info@arasmith.com
will automatically send you gateway instructions. These are about
10Kb and tell you how to operate the gateway from both directions.

gateway_request@arasmith.com
This is the address to send in a registration request. You must
include fullname, call, city/state, zip and a phone number. It
normally takes me a few hours to get you registered, it is a manual
verification process. You will be notified when the registration
is complete.

bob@arasmith.com
This is Bob's (N0ARY) address, use it when you have problems.

There is a mirror image of my setup located in Fremont CA, just across the
bay from Sunnyvale, CA. The sysop there is Pat. His addresses are:

gateway_info@lbc.com
gateway_request@lbc.com
pat@lbc.com

N0ARY also has bbss coming up in other areas of the US. I don't know whether
or not they will allow unlimited access of their gateways.

In addition, there has been recent requests for a bbs that runs on a Sun.
The N0ARY bbs does run on Suns. It was developed on a 3/80 but now
resides on his network of sparcs. Since the bbs makes heavy use of network
sockets it doesn't have to reside on a single machine although most
people run it that way. The code has also been ported to HP workstations
and 386/486s running linux. The HP and linux ports where done by Bob
Proulx, KF0UW, in Colorado.
For info on these ports try contacting him directly at
rwp@hprwp.fc.hp.com

N0ARY just went through a major upgrade in his code and will not have it
available for ftp until it has been throughly tested. This activity is in
progress. He will try to make an announcement when it is available. To get
more information about the bbs and how it functions in a unix environment
ftp the file arasmith.com:/pub/n0ary.bbs/Architecture.ps.Z. When the bbs
becomes available it will be ftp'able from that same location.

Any other questions, just yell.

Bob Arasmith
bob@hal.com (work)
bob@arasmith.com (home)
n0ary@n0ary.#nocal.ca.usa.na (packet)

Hope that helps.

3220. 4 sale bussiness radios

Newsgroup: rec.radio.amateur.misc
Date: 1994-08-26 23:00:02 UTC
From: micah@solano.community.net
Message-ID: <33ls5i$jl8@odin.community.net>
Source record: 261067

I have for sale 3 business band radios for sale.

1 uniden HT 5 watts withs rapic charger and battery pack. has multiple channels. I don't know what the frequency for it is thought it is either near the 2m band or around the 900mhz part of the spectrum.

2 moblie unity they either put out 5 or 30 watts and are made by jhonson same frequency as the ht.

the HT is for sale for 50$ and comes with the charger. the moble rigs are 100$.

Cash or money order please and I will meet almost any wear in the San Francisco Bay area. prefferably in solano county.

-Micah-

3222. Origin of "Elmer"?

Newsgroup: rec.radio.amateur.misc
Date: 1994-08-26 23:26:57 UTC
From: tconboy@uswnvg.com
Message-ID: <33783@uswnvg.uswnvg.com>
Source record: 261068

I've been a ham since 1965, but it seems to me that the term "Elmer", as applied to someone who helps you get started in a ham radio endeavor has only been used during the last 5 years or so.

Who started this "Elmer" stuff, anyway? Was I just hiding under a rock for the last 30 years?

73, Terry

3223. Santec fm-240 PL switch

Newsgroup: rec.radio.amateur.misc
Date: 1994-08-27 00:21:22 UTC
From: acs@news.sccsi.com
Message-ID: <33m0u2$k9i@tattoo.sccsi.com>
Source record: 261077

Can anyone tell me how to activate the PL tone in a Santec fm-240? I have
a borrowed unit with no manual. The rig seems to work right, and the PL
tone is set where I want it to be but, the non-COR repeaters that are on
103.5 Hz don't seem to be getting the message. HOW do I turn it on?
Thanks and 73 de A.C. in Houston.

Mike (who doesn't use a .sig) writes of Karl (who does):

Karl Beckman, P.E. < If our English language is so >
Motorola LMPS.RNSG.Analog Data < precise, why do you drive on the >
(Square waves & round corners) < parkway and park on the driveway? >
Opinions expressed here do not belong to or represent Motorola Inc.
Amateur radio WA8NVW NavyMARS NNN0VBH @ NOGBN.NOASI

I have a problem with this sig, I know what a driveway is but I do not
generally drive on a parkway, whatever one of those is. I assume it is the
path that goes through a park? There is a parkway station, but again one
would never drive on it as the roof would collapse.

Mike

Perhaps if you knew what a parkway was, and lived in an area where that
term is used, you would drive on one. Dictionaries can be so instructive:

park.way (n) A wide thoroughfare adorned with
spaces planted with turf and trees.

In other words, a highly landscaped highway. The term seems more
prevalent in the Eastern U.S. I believe New Jersey's toll way is
called "The Garden State Parkway". I hope this helps you deal
with your problem. (Oh, and don't expect to make sense of my
.sig either.) :-)

>Uh-oh. Was this a discussion about commercial useage? If so, I'm
>afraid I don't know anything on that subject, so I guess my ignorance
>is both my defense and my bliss.

Well of course you realize Mike that we hams barrowed *all* of our
prosigns from the commercial folks.

When I started Coast Guard RM school in `76 I was so surprised that
the maritime people were using ham prosigns: Q-sigs, CQ, 73, Phillips
Code (TU, SU, ABT, HW, BK, BT,...), et cetera. I was quickly made to
understand that all these originated on the maritime bands and that
hams stole them. Even the dit-dit that many CW ops end their QSO
with is a commercial tradition, and we were told to use it.

The only things that are ham inventions are the dozen or so traffic
handling Q-sigs that the ARRL invented.

73,
Jeff NH6IL

3226. Need cards for Hickock 123 tube tester

Newsgroup: rec.radio.amateur.misc
Date: 1994-08-27 03:36:49 UTC
From: arm@helix.nih.gov
Message-ID: <1994Aug27.033649.6545@alw.nih.gov>
Source record: 260980
Cross-posted to: rec.antiques,sci.electronics,rec.radio.amateur.misc

The Hickock 123 tube tester uses punch cards to adjust the
settings for each tube under test. I am looking for anyone
with either:

1) a collection of punch cards to sell. (cards from the 121 will not work).
2) blank cards to sell.
3) a collection of punch cards and the willingness to photocopy some
or all the cards.

My primary interest is in cards for early- and pre- 1930's radio tubes,
but all punch cards are of interest. Thanks.

3227. Comment 26/08/94 16:35

Newsgroup: rec.radio.amateur.misc
Date: 1994-08-27 04:03:58 UTC
From: john.rodger@takeone.com
Message-ID: <9408270818363074@takeone.com>
Source record: 260992

-> Hi John! I have been trying to fax the TCA rate card to you at 747-16
-> for the past two days but the line just rings and rings. Is this the
-> correct number and is the fax machine on standby on that line?
->
-> Thanks, Rob, VE3YE (voice phone 837-4477)

The numbed is correct Rob. My FAX is a modem connected to the computer
and sometimes does not work properly. I tested it last night and it
seems to be working again. The modem is set to pickup after four rings.
If it does not work the next time you try to send the rate card, please
use my office fax number, 990-8772.

Sean E. Kutzko (tigger@prairienet.org) wrote:

: After seeing Sharon's post on no SASE's for QSL's I wanted to add
: my two cents' worth.

: I recently went on a trip to 6Y. I worked the CW WW WPX
: CW contest as 6Y7M. This was the first time the 6Y7 prefix was
: activated. While 6Y is not a rare country, I've still received
: hundreds of cards. Many cards included an SASE, and an occasional
: envelope included a $1 plus an SASE. For this I'm very
: appreciative.
: My advice (for what it's worth): If you have a QSO with ANY
: station, DX or otherwise, and you REALLY, REALLY want that
: card, send an SASE. It shows the operator that you're SERIOUS
: about his card, and they will accomodate you faster than if
: you don't send an SASE. My return rates for my outgoing QSL
: requests skyrocketed whjen I started including SASE's in my
: QSL requests for various awards I was/am pursuing.

I do a talk at Pacific Con in Concord, Ca on Beginning HF. As part of the talk has to do with DXing I always emphasize that they should always include a self addressed envelope and a $1 bill when sending their QSL card overseas. If they QSL stateside always include a SASE and a $1 bill to help cover the QSL managers expenses or the ham's expenses. After all they need our QSL cards from the US like they need a hole in the head! 8-) I also mention that it is a privilege for us to work them and not the other way around. So be polite when in a pileup or when working them. After all they could ignore you or work you and not log you. Hehehe, which is justice served if there ever was! 8-)

On another tack, if any of you have a suggestion on what else I should include in my talk please email me. After all there are 250 new HFer's sitting out there listening to me on how to do it! 8-)

Jeff

> this subject [...]

Well well.. looks like I'm not alone! I've had my ticket for two months or so, and I'm starting to get frustrated with the constant stream of ham-radio talk on 2m and 440. Sometimes it seems like it's all talk about repeaters, ham gear, FCC this-and-than, and Nets.. I myself simply can't imagine getting excited about QSL cards and contests. :-) (To each their own, I guess.)

> I am having a hard time being understood at the other end and I do
> not know if it is the rig or if it is me or what's the problem.

Have someone nearby check out the rig, or swap with someone for a while. It sounds silly, but make sure you're using the right angle and distance for the microphone. This can make a big difference.

> Anyway, I'm starting to get dissapointed with VHF ragchewing, I've
> seen better opportunities for conversation in a bar full of couples.

Heh heh.. yup!

> Well, maybe because people do not know what to say. It is hard to
> sit down and talk, specially if you are introvert.

Yep. As an geek and introvert, I have to agree. :-)

I think I've narrowed it down to a couple of hangups, for me anyway:

1) You don't know anything about the person you are talking to. Even when you meat someone in a bar, you can look at them and tell if they are neat and buisnesslike, grungy, friendly and smily, sour, or what. Radio gives you none of that. You're just a voice, with no T-Shirt logo hints for favorite interests and such.

I think that's why conversation always seems to revert to ham-radio. It's the only thing you know you have in common.

2) It's half-duplex! This is hard to explain, but if you make some joke on the air, you have no idea if anyone even chuckled, or groaned. Telephone gives you this. Same for the "ack-grunts" that let you know the other person is still there and following along, and maybe agrees.

Another problem is that you can't interject like you're used to in full-duplex. You can't just wait for the other person to subtly say

"Hmm" or "Yes, but". You just say your piece, and then step down. It's almost subconcious, but real conversation isn't at all like this. Often you talk until they have something to say. You can also stop talking when they don't look interested. :)

3) There is too much "clubness" to local air chatter. It's just loaded thick with jargon and jive like QSL, "monitoring", XYL, and such.. That's normal for any hobby, I guess, but sometimes all the protocol really gets in the way of a good talk. (Ask me in a few years, and see if I've QSY'd :-)

4) There really are some folks out there that are much more interested in excersizing the RF spectrum than having a stimulating converstion. They are always testing this or that feature, or talking on three bands at once, tweaking the antenna, checking their signal, or accessing every feature of the repeater. I'm hoping these people are just few and verbose.

> Many of those loner and geeks are introverts, they might feel more
> comfortable doing CW, packet or RTTY than phone.

Naw.. packet conversation is just as unstimulating, at least what I've seen. It's all ham-chat.

Just imagine a Usenet with *only* the news.software.* hierarchy, and you have a parallel. :-)

What to do about it?? Well.... it's just like a telephone, I guess. A radio is only as interesting as the person on the other end. It's my job to find cool people to talk to, and seek out meaningful conversation.

Try finding someone you know well that is also a ham, even if they aren't on the radio any more. Lend them an HT or get them to dig theirs up. Somehow, those conversations are always just fine. I guess this just shows it's easier to sustain an enjoyable conversation with someone you know than someone you don't.

3234. Ten Tec Corsair stability

Newsgroup: rec.radio.amateur.misc
Date: 1994-08-27 07:15:45 UTC
From: turner@safety.ICS.UCI.EDU
Message-ID: <9408270015.aa09744@paris.ics.uci.edu>
Source record: 260993

Anyone out there with the Ten Tec Corsair try to stabilize the PTO more than Ten Tec did? Mine really doesn't drift much to speak of, but it is enough that with my 250 Hz filter in CW, after a time I have to think about it.

I have heard that there is some fellow in the South somewhere who did a comparator circuit (?) to stabilize the PTO really well. Anyone have any info on this or any other ideas?

Clark

You are exhibiting much correctness, sir. For the most reasonable
explanationof this that I've ever heard, allow me to quote unto you
from David Feldman's "Why Do Dogs Have Wet Noses...?"
in which he quotes himself in "Who Put the Butter in Butterfly?":

"One of the main definitions of -way- is "a route or course that is
or may be used to go from one place to another". New York's Robert
Moses dubbed his "route or course that was used to go from one place
to another" -parkway- because it was lined with trees and lawns to
simulate the beauty of a park. The -driveway-, just as a -highway-,
a -freeway-, or a -parkway-, is a path for automobiles. The driveway is a
path, a -way- between the street and a house or a garage."

We do indeed call ours the Garden State Parkway, although waiting at the barrier tools that slow traffic to a crawl, it is sometimes like sitting in a driveway.

For reasons beyond my comprehension, driving on -parkways- does indeed seem to be a Northeastern thing. Others that spring to mind are the Merrit, Sprain, and the Saw Mill (River). When one says "The Parkway" in NY Metro however, it usually means the GSP.

BTW, I highly recommend Mr. Feldman's Imponderables books for fun and dispute resolution. They include:

"Why Do clocks Run Clockwise..?"
"Who Put the Butter in Butterfly..?"
"When Do Fish Sleep...?"
"Why Do Dogs Have Wet Noses...?"
and, of course, the original "Imponderables..."

From: rpmccoy@BIX.com
Message-ID: <rpmccoy.777992220@BIX.com>
Source record: 260991
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.antenna

Jeff,

I use the Outbacker as a portable antenna. The ball mount
from a Hustler BM-1 bumper mount fits nicely over a
one foot length of 1" PVC, pushed in the ground.

Or, I use the above with a PVC 'H' stand as pictured
in the May, 1994 QST article on constructing a small
loop antenna, using 1" PVC. The PVC fits well enough
to eliminate the need for glue. This allows construction
with 2 ' lengths for easy packing.

I use a 1/4 wavelenth counterpoise wire or ground radial.
A length cut from 2" copper foil works best, but I also
use 300 ohm twin lead shorted at the end, or other
insulated wire. Watch for RF burn on the counterpoise!
Tape the end of the wire or use the foil when others are
not present.

My HP113BR has had a mechanical failure in the clock gear train. I'd like to find a replacement for the clock assembly, or if necessary, I'd purchase a complete HP113BR. If someone out there has a working HP 115BR, that would be even better.

Also, fwiw, I'd like to find an HP106A or HP106B.

Anyone having any of these items for sale, please send me mail at knight@ka1dt.mv.com or knight@caboom.zko.dec.com. Please give condition and price in message.

Thanks, Dave Knight, KA1DT

steve@vigra.com (Steve Haehnichen) says:

>>Well well.. looks like I'm not alone! I've had my ticket for two
>>months or so, and I'm starting to get frustrated with the constant
>>stream of ham-radio talk on 2m and 440. Sometimes it seems like it's
>>all talk about repeaters, ham gear, FCC this-and-than, and Nets.. I
>>myself simply can't imagine getting excited about QSL cards and
>>contests. :-) (To each their own, I guess.)

I see a lot of posts like this. So can I ask, in what is meant to
be a completely non-inflammatory way, what attracted you to amateur
radio in the first place?

In my case, I was an SWL for a year or so as a teenager, and decided
that CW DXing was what I wanted to do, so I got a license and have been
doing it ever since. I knew what I was getting into, and while I do a
few other things beside DXing, they alone would not be enough to keep
me interested in the hobby.

When I got on the air, it was just as I imagined it would be - there
were no real surprises and I didn't get tired of it after two months.
Getting a license doesn't magically make you, or anyone else, a more
interesting person. I assume that you listened to hams for some time
before going to the trouble of getting a license - has anything changed
since then?

By your own admission, you're not interested in contests or DXing, and
you don't like "ham-radio talk" - what would make it more interesting
for you?

TN>>directly to Gettysburg on July 18. My new license is effective August 15,
TN>>was postmarked August 17, and arrived today, August 19. The new effective
TN>>date is exactly 4 weeks from my 610 mailing date.

TN>>Just makes you wonder, how much more work can it be to issue a new license
TN>>vs. process a renewal? 17 weeks vs. 4 weeks? I guess there are just less
TN>>applications in the renewal pipeline and they push them right through...

TN>>Well now I am good for another 10 years :-)

I think many newbie licensees and others awaiting upgrades are
ignoring something at FCC that is different in 1994 from prior
years: This is the first renewal time for the 10 year license
which term was begun in 1984.

So everyone who first was issued this 10 year license in
1984 is mailing in their 610's, myself included. The FCC
is getting a great pile of renewals over and above new issues
and upgrades.

Aries or ARES?

Aries is available from Ashton ITC for $89.00 (when last I asked).
PO Box 830 Dandridge TN 37725 or phone 1 (617) 397-0742
It is a contest and logging program that includes the software to
run Icom radios with the CT-17 cntroller.

ARES is the Amateur Radio Emergency Services psuedo-bbs package. I
believe it is available from the ARRL and/or TAPR.

> looks like you don't know what you're talking about, now doesn't it?

It *never* fails to amaze me how people can read something and be
completely incapable of understanding what they have just read.

Clueless Joe, that's you're new name on this group. How many people own
Icom radios? How many require service? How many phone calls does Icom have
to deal with from people that can't be bothered to read their owners
manuals? And you want Icom to hire extra people full time just so that
when *YOU* call, you might not have to spend a few extra dollars or be
inconvienced by having to wait a few minutes?

I'm sorry if it offends you that I have money to spend on equipment, or
especially if I choose to spend it on phone calls, shipping materials
or service manuals.

73 es GA from Jeff, have a nice day Joe, I know I will.....

3247. Rayleigh Law

Newsgroup: rec.radio.amateur.misc
Date: 1994-08-27 21:21:00 UTC
From: forrest.gehrke@cencore.com
Message-ID: <6e.3424.332.0N66690E@cencore.com>
Source record: 260937

KL>>Can someone explain in simple to language to one who should
KL>>know (me) why this antenna doesn't obey the law of reciprocity
KL>>or whatever it's called? Are there other types of antenna
KL>>that are good on transmit or receive only? This sounds like
KL>>the end of the Nth law of thermodynamics.

It's called the Rayleigh Law from its discoverer. However
it does not apply when propagation is appreciably affected
by an ionized medium in the presence of a magnetic field.
As you well know, our planet Earth provides these characteristics.
The band of frequencies we know as HF are affected which
means that reciprocity is not assured at these frequencies.
By reciprocity is meant when a voltage E applied to antenna #1
causing a current I to flow in antenna #2, then that same E
applied to antenna #2 should cause the same current I to flow
in antenna #1.

This has nothing to do with why a Beverage antenna is not a
good transmitting antenna. Recall that the Beverage is
a very low gain receiving antenna, much lower than a dipole;
it is just a very highly directive antenna and therefore its
poor gain in the favored direction is enhanced by its
absolutely atrocious gain in other directions. That makes it
a good receiving antenna in the presence of noise and signals
arriving from other directions.

But as a transmitter? Why would we want to start out at such a
disadvantage of poor gain, even in the favored direction? The
transmitter cares not a whit for noise and other signals.

The Beverage has little discrimination for signals in its
favored direction from whatever vertical angle. I built
one of 3 wavelengths towards Europe for 80M but while
great for pulling out weak European signals, the signals
from Maine, VE1 and VO were outstanding! I had to go
back to vertical arrays which skipped over those people
on receive.

oo7@astro.as.utexas.edu "Derek Wills" writes:

> We see a lot of requests here for computer programs by people interested
> in learning "the code". Some of us real oldies who were born before
[snip]

Well, here comes my $US 0.02 worth (~$AUS 0.03; or ~UKP 0.01) ...

I've seen quite a few postings on this one. I speak / write as someone who learnt code from three methods:

1) tapes;
2) on-air copying of 80 m ham traffic (fairly tame - all vk novices tx'ing nice & slow), marine traffic lists (callsigns were sent twice), and wx reports; and
3) using code practice oscillators & keys.

I passed my 5 wpm rx test with 1 error, and my 10 wpm with none! I subsequently became vk4vle in late 1981, and upgraded to vk4bmd within 3 months.

I remember my first *real* cw qso - it was on 20 m. I don't think any amount of preparation on my part would have made it any easier! I'd had *tame* qso's on 10 m across town, but you can imagine just how tame that was! In that qso on 20 m, I was suddenly hit with the full gamut of abbreviations, interference, fading, noise, the requirement for a near-immediate reply (otherwise the guy started calling back to see if I was still there!), and just sheer nervousness. It was what one would call a template qso.

After my first few nights on 20 m, I started to find things a lot easier. By the end of the month my speed had increased, I had developed the "human ear adaptive filter" technique needed to wrest the wanted signal from the 3 others qrm'ing, could start to compose a reply while copying (hard copy, too) the incoming traffic, and could also send in the "off the cuff" style so very important to conversational cw.

My first three months as a full call in 1982 were filled with cw qso's ... why? Two reasons:

1) I enjoyed using the medium (yes, the "hollywood" bit initially applied!) - especially in conversational mode; and
2) I'd borrowed "my" first all-band rig off an old ham friend - a dedicated cw op - and he "conveniently" failed to provide a microphone when I picked up the rig!

Some of my most memorable qso's have been on cw - the majority of them to those folks across the water in w / n / k land. They were all amazed that I

could reach them nightly on 20 m using 10 - 20 W and a dipole. It was fun!

Now, I'm not on air much. But, I want to get back to it all soon - especially when I get back to vk . I'm using the PC and cw program to get my copy speed up, and am finding that it *will* change my operating technique. I'll definitely be using a typewriter or keyboard to copy the traffic, but NO pc-driven code reader! I'll try to stick with my old PMG No.2 key, but I *might* go to an iambic, or something along those lines.

73's all

Source record: 261008

This message is being posted as a favor to a friend without netnews access. It is not an official statment of anything, let alone Eastman Kodak. Please e-mail davev@atkc.com or dkerk@ctp.org. Mail sent to this address will be trashed.
==========
Hi, by wife and I will be visiting my aunt and uncle in West Orange, and info on a good local West Orange repeater would be appreciated. They're up the hill from the old Edison museum, not that far from the area where the Edison house is. I remember there being a Path Mark mar et and a Christian radio station nearby that bled all over EVERYTHING, but this was back in 1989.

Anyway, I will have a pair of HTX-202s, one for her and one for me, and I just wanted something to keep in touch when we are apart. SOmething local and quiet is ideal. Any 2 meter repeater info for the area will be MUCH appreciated. By the way, if there are any good open 2m repeaters in midtwn Manhattan, around 47th st and 7th ave, that would be appreciated too.

Please reply to davev@atkc.com or dkerk@ctp.org

Thank you KE6GXD & KE6KFN

Modifications, Undocumented Features, and Bugs for the Kenwood TM-733A.
August 22, 1994. Release 1.1

This document is a compilation of Internet messages from
Steve Haehnichen KE6JGK and Brad Killebrew N5LJV, edited by Brad Killebrew.

Extended RF Modifications

Remove power source from the radio.

Remove the display panel.

Remove the top cover the radio.

Face the front of the radio away from you.

Remove the speaker.

Looking from the back of the radio, the control board is vertically
mounted just behind the front panel wall (which can be removed easily
if better access is needed.)

Just to the right of a chip labeled XRU4066BCF and just to the left of
two green wires (B2 & B3 which are draped over the board to the rear) are
two zero-ohm SMT resistors, B0 and B1, marked "000".

Remove B0. (the one on the left - furthest from the green wires)

Taking it out might be a bit tricky. It's glued down for surface-mount
assembly. Be careful not to pull the trace from the board.

Perform a CPU reset by holding [MR] while turning on the radio. It
will then ask if it is "OK?" to reset, press [MR] again.

The ranges after modification are as follows:

Tx: 136-174 410-470
Rx: 118-174 300-470

The cellular band is indeed missing.

Removing Jumper 1 (B2) ONLY is the MARS/CAP modification. (The green wire on the left).

DTFM Remote via Microphone

The TM-733 is fully DTMF remotable via the microphone (documented). The radio can also be externally DTMF controllable with an HT, but that will be described later.

The DTMF control keys are exactly as shown on page 81 of the manual. Note that the microphone is active all the time, so any ambient DTMF tones near your mic will also change rig settings. This includes tones coming in on the other band and out the speaker.

Cross Band Repeating

Cross band repeat isn't documented but comes ready from the factory. To enable cross band repeat from the front panel, first select a band by pressing BAND SELECT. Then, change the control to the other band by hitting [CONT SEL]. Next, press [F] for one second, then the "X" button (far right side). Decimals will appear between the Kilohertz digits, and the "ON" indicator will light momentarily. The microphone sequence to enable cross band repeat while in remote control mode is "DC".

The transmitter hang time can be toggled between 500ms to 0ms by turning on the radio with [LOW] pressed. They also recommend enabling the Time-out Timer, for obvious reasons.

DTMF Paging and Squelch

The DTMF Paging & DTMF Squelch protocol (AAA*BBB) is compatible with the Yaesu 530 and all Kenwood radios supporting this.

DTMF Monitor

There are some serious bugs in the "DTMF Monitor" feature (Page 63: [PTT] + [DWN] + Power On). This feature supposedly lets you hear the DTMF tones you are transmitting. The first problem is that it only gives you a short tone from the internal speaker. This is not true to the transmitted tone that lasts as long as you hold the key. The much bigger problem is that it mixes the desired tone and the feedback tone resulting in an almost indecodable DTMF tone. Kenwood is aware of this bug.

Front Panel

There are two undocumented icons on the display; one is the "heart" symbol. Anyone know what that's for? It could just be a spare. I noticed they used the odd "spade" symbol to indicate AM receive, so maybe these were last minute extras. Dunno..

>From looking at the schematic, it seems that the only programmable memory is physically located in the detachable front-panel. I think this means that if I use my front-panel on someone else's radio, I get all my memories and settings. Anyone try this?

The whole front panel is connected to the rig by four wires (yep, including the volume/squelch pots.) According to the schematic, these are: power, ground, data in, and data out. I'm wondering how hard it would be to make a PC interface for this thing and replace the whole display and controls with a full-screen version. It wouldn't surprise me if many of the programming limits were also imposed by the front panel, and not the unit.

Wireless Cloning

The advertised but undocumented Wireless Clone function is described in App Note AAN-0008 which they will mail out on request. (Maybe if enough people ask for it, they will include all the functions in future instruction manuals.) In summary:

- Prepare the two radios for simplex operation on the same frequency.
- Turn both radios off
- Press [CALL]+[SHIFT] + [Pwr On].
- This should place the radios is clone mode with "CLonE" on the display.
- Press PTT on the "Master" radio momentarily. This will start sending the programming DTMF tones.
- After all data has been transferred, the display of all radios will read "End", indicating success.
- If the signal is interrupted or corrupted, the "Slave" displays will read "Err". Turn them off and try again.

Notes:

- Both the Master and Slave radios must have the same number of memory channels available for each band. Example: You can not clone a stock Master to a Slave with ME-1 memory expansion.
- You can not clone between different Kenwood radio models, even if they seem identical.

Be careful when using the clone feature. It has been known to wipe out or scramble memories on the master radio during or right after clone.

Bugs and Problems

To date, I have logged two trouble reports with Kenwood.

The first is the well-known (but still denied) problem with the transmitted PL (CTCSS) tone. The tones are filthy. They contain many harmonics and synthesis noise. I'm guessing this is because they are using 7-bits from the CPU and a resistor net (DAC) to synthesize the tone. The sound/intensity of the noise depends on the actual frequency being generated. (The PL tones also come out of the radio's speaker while transmitting. Weird, but not a problem.)

The PL noise seems most messed up (on my radio) at 107.2 Hz, where the noise beats with the tone. Go simplex and ask someone to describe the noise to you, or listen carefully to your own speaker while transmitting. Some repeaters do a better job than others of hiding the noise for you.

Kenwood's response to this complaint seems to vary depending on who you talk to. One tech (I wish I would have got his name!) acknowledges the problem, and says they are working on a fix. He guessed that it involves changing a resistor. This would imply (to me), that they are simply turning the PL deviation (strength) down a bit to hide the noise. Unfortunately, this may make the PL less reliable for getting into repeaters. This is not an acceptable fix for me, so I'm insisting that they describe the modification to me before I send the radio in for repair. So far, no luck.

Other representatives will deny that they have heard of the problem. I don't know the cause of this, because it's a well-known and frequently discussed problem among local hams.

The Service Manual specifies a test for the PL. The technician is simply required to verify that any one PL tone is between 500 and 1500 Hz deviation. This is quite a wide tolerance range! The "standard" PL tone deviation should be 750 Hz. Twice that strong might be too strong and become audible. There are no trim-pots on the PL deviation, so I'm guessing that the deviation is pretty constant from radio to radio.

The other problem concerns the DTMF Confirmation Tones. This feature is off by default (I wonder why :), while it seems pretty useful. To turn it on, press [PTT] + [Down] on the microphone while powering the radio on. This will generate short DTMF confirmation tones whenever you send DTMF over the air from the keypad. Unfortunately, it mangles the beginning of the outgoing DTMF tone! This is serious enough that most local repeaters can't detect the tone, or count it as two tones.

Get a receiver and listen to what you are sending out when the Confirmation tones are enabled. It sounds to me like they may be mixing the confirmation tone in with the real tone and getting some destructive interference. Just a guess, though.

I called a Kenwood technician (Ricardo) and worked with him on the phone to reproduce the problem there. So, as of today, this is a Known Problem, and they are looking into a fix. :-)

I am really curious to know what they would say if other folks called up and complained about this problem. Would they deny hearing about it, or would it really be a Known Problem? Might give some insight into the PL-noise denial thing anyway. :-)

Personally, I'm much more concerned about the noisy PL than the DTMF confirmation tones, since I can just shut those off and pretend that feature doesn't exist. If enough people call about the PL problem, maybe they will come out with a real fix and offer it under warranty to all the radios out there (since they're all pretty new). My guess is that it will involve a free TSU-8 tone decode module, but don't hold your breath. :-)

Check your PL, and if it bothers you, call them! Their support number is: 1-310-639-7140, and you press [2] at their voice menu to get to the Amateur Radio department (8:30AM - 5:00PM PDT). So far, they have been fairly knowledgeable and responsive, and they always call back the same day if they're busy or stumped. I just wish they would offer a real fix.

External DTMF Remote Control

The following procedure places the 733 in External DTMF Remote Control.

Note that this mode is different then DTMF Remote Mode. This mode concerns the control of the 733 with an HT, and not the microphone.

- Press Band Select and select the UHF band.
- Pick a UHF control frequency.
- Turn on the UHF DTSS function and select a tone sequence. (p. 89)
- Turn the UHF DTSS function back off.
- Press Band Select to move to the VHF band.
- Press [CONT SEL] to move control back to the UHF band.
- Turn OFF the radio, press and hold [CONT SEL] while turning the radio back on, then release [CONT SEL]. The S-meter scale and the DT indicators for the UHF band will begin flashing. The LOCK indicator will turn ON, and most front-panel keys (except PWR) will be disabled.
- To begin remote control, you should key the external radio and press the following key sequence: "Axxx#" where "xxx" is the preset DTSS code selected earlier.
- If the proper code is received by the 733, the beeper will sound and the DT indicator will stop flashing. The radio can now be remotely controlled using the function chart below.
- To return to standby mode, press "A#" on the remote radio.
- To return the radio to normal operation, turn the radio off, then press and hold [CONT SEL] while turning the radio back on.

Refer to this chart when using the TM-733 in "External DTMF Control".

1 2 3 A
T.ALT ON TONE ON CTCSS ON ENTER

4 5 6 B
T.ALT OFF TONE OFF CTCSS OFF TONE SEL

7 8 9 C
CALL VFO MEMORY REPEATER ON

* 0 # D
DOWN POWER LEVEL UP REPEATER OFF

There are no "shifted" functions. Just one function per button.
After you hit "B" for TONE SELECT, press * or # to go up or down,
and same is true when in VFO mode or in MEMORY mode.
Tones 7, 8, and 9 mimic the three buttons at the top of the 733 mic.

Pressing "C" places the radio in cross band repeat mode. You will
recognize this because the of the dots between Kilohertz digits.
After pressing "C", put the radio back into standby mode with "A#".
The 733 will now cross band repeat. To disable cross band repeat, place
the radio back into the External DTMF Remote Control with "Axxx#".
If you can read through the lines, the 733 is capable of operating
as a frequency agile remote base. Now Kenwood just needs a CW IDer.

Assembly Mode Test

In the TM-733 Service Manual, it describes a test mode that I haven't
seen mentioned anywhere else. So, here's the scoop:

Entering Assembly Mode: [CALL] + [MUTE] + [Power On]
All LCD segments should come on. (To exit, power off.)

Press the [VFO] key. *This must always be done first*
The serial port is checked and "F" with "80" on the display indicates
test passed. "1" or "2" means failure.

Different keys now show different displays, with [LOW], [SHIFT],
[TONE], and [REV] also adjusting the backlight intensity.

Set the dials to minimum, then press the [MR] key. Each of the dials
shows the digitized level.

This looks useful for checking all the keys and dials when you suspect
a bad connection.

Radio Versions & Freq. Ranges

Out of curiosity, I've been trying to figure out how other variants of
the Kenwood TM-733A can be easily "mutated" from the American "K"
version.

Here's what I've come up with so far. I'm curious to know if anyone
else has tinkered with this stuff. I figure since the radio is so
new, every one out there is still under warranty, so there probably

aren't many folks poking about with a soldering iron...

The K and P (Canadian) models seem physically identical so far. Only the warranty card has a different part number. Is there anything else I've missed?

The M2, M3, M4, and E2 models have the most liberal Tx frequency ranges: 136-174 & 410-470 MHz, instead of the US ("K") version's: 144-148 & 438-450.

The K version already has the widest 2m/70cm Rx range possible: 118-174 & 410-470, so there won't be any mods there.

The K and P models are lacking significant hunks of the 800 MHz Rx circuitry. In addition to some caps and inductors to link in the 800 MHz font end, IC202 is completely missing (the chip with "80R" output). I think it's a custom chip, so there's not much chance of finding one. ALL models other than K and P have this chip. If you're really desperate to get the 800 MHz Forbidden Band, you'll have to buy another radio, or try to order the chip from Kenwood Parts.

Also, K and P models have a "KCB20" for IC209 instead of KCB14. This is the "430 MHz Transmit Drive" chip. I think K is optimized for ~445 while the other is centered at ~435, but I'm guessing. The test/calibration instructions use different test frequencies for the two models, so there is probably some difference in the specs.

As for the CPU, it seems to detect which model it's in by reading pins 90 through 93 on power-up. (These are output lines to the DTMF encoder after power-up.) The pins are selectively pulled hi/low by wires and resistors to set the model.

If anyone knows how to override this setting by front-panel (software) controls, I'd be very interested to hear it!

As for hardware configuration, here's the info:

There are two wires (W1, W2) installed on the CPU board that apparently bypass resistors, tying the lines hi via 10k ohms (CP402 Rpack) instead of low via 100k resistors (CP403 Rpack). There are also three zero-ohm resistors that do something similar.
For those of you following along at home, that does indeed make five select lines, with only four going into the DTMF chip. :) I'm not sure about the fifth one, R413. It goes lots of places, including several dispersed pins on the CPU. It's only installed on the M4 (Chinese) model of the radio. Since the M4 model also uses a Chinese front-panel display, this line probably selects different glyphs and such. It's also tied into the descriptionless pin 77 of the CPU, called "RPT" (cross-band repeat?). Maybe they can't sell cross-banders in China.

The other four: W1/R410, W2/R411, R412, and R414 are the selectors that pull on the DTMF data lines. If we ignore the M4 and E models

(which have more unique components), the K and M2/3 models have only
these differences:

W1,2 R414
K,P Yes Yes
M2/3 No No

I'd bet one of those accounts for the different Tx range limits on the
CPU. Maybe the other allows for 800 MHz frequency tuning.

----------snip here and print----------

Kenwood TM-733A Quick Reference Guide by Brad Killebrew N5LJV

[#] PRESS A NUMBER, NOT THE POUND SIGN.
[KEY] PRESS AND RELEASE [KEY]
[KEY1]+[KEY2] PRESS AND HOLD [KEY1] DOWN, THEN PRESS [KEY2]
[KEY1],[KEY2] PRESS [KEY1] MOMENTARILY, THEN PRESS [KEY2]
[KEY]+[PWR] WITH POWER OFF, PRESS AND HOLD [KEY] THEN HIT [PWR]
[KEY1]+[KEY2]+[PWR] YOU GET THE IDEA.
[F] (1s) PRESS AND HOLD [F] FOR ONE SECOND. "F" THEN BLINKS.
[KEY] (1s) PRESS AND HOLD [KEY] FOR ONE SEOND.
[F],[KEY] (1s) PRESS [F] MOMENTARILY, THEN PRESS [KEY] FOR ONE SEC.

The following entries are listed in the order as they appear in the manual.

RECEIVE AUDIO SWITCHING [F] (1s) [CONT SEL]
AUTOMATIC SQUELCH [MHZ] + [PWR]
S-METER SQUELCH [F] (1s), [S.QSL]
SQUELCH HANG TIME [F]+[DIM]
RD OUTPUT SQUELCH CONTROL [TONE]+[PWR]
VHF+VHF OPERATION [F],[CONT SEL]
UHF+UHF OPERATION [F],[CONT SEL]
TRANSMIT BAND LOCK [F],[BAND SEL]
BLANKING A BAND DISPLAY [F] (1s), [BAND SEL]
VFO TUNING LIMITS [F]+[C.IN],(L.FRQ)[MR],(U.FRQ)[MR]
AM/FM MODE [MHZ] (1s)
FREQUENCY STEP SIZE [VFO],[F],[STEP]
1 MHZ/10 MHZ TUNING TOGGLE [VFO],[F]+[MHZ]
POWER OUTPUT [LOW]
TIME-OUT TIMER [F] (1s),[TOT]
WRITING MEMORY (SIMPLEX, DUPLEX) [F],(FREQ),[MR]
WRITING MEMORY (ODD SPLIT) (RX FRQ),[F],[MR] (1s),(TX FRQ)[MR]
MEMORY TO VFO TRANSFER [F],[VFO]
ERASING MEMORY CHANNELS [MR],[F]+[MR]
RECALLING MEMORY CALL CHANNEL [CALL]
CHANGING CALL CHANNEL (SIMPLEX,DUPLEX) [F],[C.IN]
CHANGING CALL CHANNEL (ODD SPLIT) (RX FR),[F],[C.IN] (1s),(TX FR)[CALL]
CHANNEL DISPLAY FUNCTION [REV]+[PRW]

INITIALIZE VFO ONE BAND [VFO]+[BAND SEL]+[PWR]
INITIALIZE VFO BOTH BANDS [VFO]+[PWR]
FULL RESET (MINUS PM) [MR]+[PWR],[F],[MR]
FULL RESET (PLUS PM) [MR]+[PWR],[MR]
STORING PROGRAMMABLE MEMORY [F],[PM],[#]
RECALLING PROGRAMMABLE MEMORY [PM],[#]
ERASING PROGRAMMABLE MEMORY [F]+[PM],[#],[MR]
CANCELLING AUTOMATIC OFFET [VFO]+[REV]+[PWR]
AUTOMATIC SIMPLEX CHECKER [REV] (1s)
SELECTING A CTCSS TONE FREQUENCY [F] (1s),[T.SEL],[UP]/[DOWN]
DTMF CONFIRMATION TONES [PTT]+[DWN]+[PWR]
STORING DTMF IN AUTOMATIC DIALER [F]+[CALL]+[PWR],{#'s},[PF],[#]
RECALLING STORED DTMF NUMBERS [F]+[CALL]+[PWR],[MR],[#]
TRANSMITTING STORED DTMF NUMBERS [PTT]+[PF],[#]
SCAN RESUME TOGLE (CO, TO) [F] (1s),[VFO]
MEMORY SCAN [MR] (1s)
LOCKING OUT MEMORY CHANNELS [MR],[F] (1s),[MR]
BAND SCAN [VFO] (1s)
PROGRAMMABLE BAND SCAN [F]+[VFO],(L.FRQ),[MR],(U.FRQ),[MR]
CONFIRMING PROGRAMMABLE LIMITS [F]+[VFO],(L.SHOWN),[MR](U.SHOWN)

TS>>DX IS !!!!!
TS>>And always will be.....

Hi Tom!! This is an unrelated response, but I couldn't resist when I saw your posting. I have some of your qsl's on the wall and this is the first time I've seen you on the net. My name is Dave, and I worked you mobile on 20 once and I have a card when you were /VP9 (I think...I'm at work, heehee). Anyway, nice to hear (er...see) you on the net es tnx for the nice cards! 73 de WB4IUY

>telescope?

Don't know about a reflective radio telescope, but amateur radio (ham)
operators have frequently bounced their radio transmissions off the Moon.
Usually using VHF (30 to 300MHz) or UHF (300 to 1000 MHz) frequencies.
These frequency bands almost never bounce off the ionosphere, so to get
long distance communications (intercontential), hams bounce their signals
off the Moon. It ain't easy, they need high power and directional
antennas and low noise sensitive receivers. It's called "EME".

How about when you retire from the United States Air Force after 20 long years, and then go to school for six months <looking for work all the while and not finding it> and then end up working at your favorite ham radio store...

Happened to me!

If you are looking for the best way to go Motorcycle Mobile contact Ray Davis, KD6FHN he is the president of MARC here in Orange County MARC is Motorcycling Amatuer Radio Club 714-551-1036. I would go into more detail, but being in the Retail Business I dont want this to be misconstrued as touting the Store. I will tell you we do all types of installs on GW's up to and including TS-50S, TM-742's, and all type of antenna installations. We also have custom Brackets for all late model GW's. But call Ray and he will fill you in on what is available for the Bike. His group and out installs were just featured in 73 and WingRider I hope this helps. Tell Ray that Uncle Bubba told you to call him

3260. How to find the answers to frequently-asked questions about Ham Radio

How to find the Rec.radio.amateur.misc Frequently Asked Questions list
---

This article will tell you how to find the answers to frequently-asked Questions (FAQ) from rec.radio.amateur.misc. The FAQ articles are posted on the 7th and 21st of each month. This article is posted on the 14th and 28th of every month as a reminder of where to find the FAQ.

The FAQ articles are intended to summarize some common questions on the rec.radio.amateur.misc newsgroup and Info-Hams mail list as well as to help beginners get started.

Besides the monthly posting, the FAQ is always available via anonymous FTP and from e-mail servers. This article contains instructions for obtaining a copy of the FAQ. It also contains the table of contents from the FAQ so that you know which questions are covered by it.

Please provide a copy of the FAQ to any new or soon-to-be Hams you know.

Regular FAQ postings can help save network bandwidth and maintain a good signal-to-noise ratio in the newsgroup. However, they can't do it alone - you, the reader, have to use them. If you are a new user, please print and review the FAQ articles and look at the instructions in the news.newusers newsgroup before posting any articles. If you are an experienced user, please help by refraining from answering frequently-asked questions on the newsgroup if they are already answered by the FAQ articles. Instead, send e-mail to the user who asked the question. (It will be helpful if you include the part of the FAQ that answers their question, but not the whole thing.)

--How to obtain a current copy of the FAQ---

There are 7 ways to obtain a copy of the FAQ.
1) World-Wide Web (WWW) and Mosaic
2) NetNews
3) Anonymous FTP
4) An Electronic Mail Server
5) Mail List Subscription
6) Gopher
7) Wide Area Information Server (WAIS)

Option #1: World-Wide Web (WWW) and Mosaic

The World-Wide Web (WWW) has experienced explosive growth in usage in 1993

and 1994. WWW clients like Lynx (in ASCII text) or Mosaic (X/Mac/Windows) can display the FAQ from many different sources. Each source is named by a URL (uniform resource locator.) If you are one of the growing numbers of people with Internet access, Option #1 is your choice. The following URL can be used to find the FAQ:

http://www.cis.ohio-state.edu/hypertext/faq/usenet/radio/ham-radio/faq/top.html

Other services listed later in this article are also accessible with WWW at the following URLs:
news:rec.radio.info
file://ftp.amdahl.com/pub/radio/amateur
file://ftp.cs.buffalo.edu/pub/ham-radio
file://rtfm.mit.edu/pub/usenet/news.answers/radio/ham-radio/faq
file://grivel.une.edu.au/pub/ham-radio/buffalo/ham-radio
file://nic.funet.fi/pub/ham/info
gopher://cc1.kuleuven.ac.be/
gopher://jupiter.sun.csd.unb.ca/
gopher://gopher.univ-lyon1.fr/
gopher://ftp.win.tue.nl/
gopher://gopher.win.tue.nl/
wais://rtfm.mit.edu/usenet

For more information on WWW, see the comp.infosystems.www newsgroup. Also, the help options on your WWW client should be able to point you to lots of information all over the world.

Option #2: NetNews

If you are familiar enough with NetNews to look through previous articles on your system, Option #2 above may be the easiest for you. The FAQ is posted so that it should not expire from your site's news spool until the next one is posted. Unfortunately, some news administrators do not honor the expiration dates meant to preserve the FAQ.

Look in rec.radio.amateur.misc, rec.radio.info, rec.answers, or news.answers. If the FAQ has expired at your site, try Option #3 (and ask your news administrator to honor expiration dates for articles cross-posted to news.answers if he/she can.)

Option #3: Anonymous FTP

Anonymous FTP uses the File Transfer Protocol. It is only available to sites which are directly connected to the Internet. If you don't know how to use FTP and can't find a friend to help you, continue to Option #4. If your site is not connected to the Internet, you should also continue to Option #4.

The following sites have copies of the FAQ:
site name & address path to FAQ articles
------------------ --------------------
ftp.amdahl.com pub/radio/amateur/faq.[1-3].Z
located in western USA, FAQ updated daily

ftp.cs.buffalo.edu pub/ham-radio/faq_ham_[1-3]
located in eastern USA, FAQ updated monthly
rtfm.mit.edu pub/usenet/news.answers/radio/ham-radio/faq/part*
located in eastern USA, FAQ updated monthly
contains news.answers archive - most UseNet FAQs are here
grivel.une.edu.au pub/ham-radio/buffalo/ham-radio/faq_ham_[1-3]
located in Australia, FAQ updated monthly
(Ham files mirrored from buffalo/funet/ucsd daily)
nic.funet.fi pub/ham/info/faq_ham_[1-3]
located in Finland, FAQ updated monthly

Remember, when connecting to the remote system, use the login name of
"anonymous" and, as a courtesy to the site administrators, your e-mail address
for the password.

Option #4: Electronic Mail Server

If you can't use Options 1 or 2, your only remaining option is electronic mail.
You can retreive a copy of the FAQ by sending a message to
mail-server@rtfm.mit.edu

The body of your mail will contain a command for the mail server software.
To get all of the FAQ (consisting of 70K of e-mail in 3 parts), place the
following in the first line of your message:
send usenet/news.answers/radio/ham-radio/faq/*

Leave out the subject of your message because the mail server will ignore it.

--- begin sample mail message ---
To: mail-server@rtfm.mit.edu
From: me@here.org
Date: Mon Aug 14 22:27:33 PDT 1995

send usenet/news.answers/radio/ham-radio/faq/*
--- end sample mail message ---

Option #5: Mail List Subscription

If you prefer, you may get the FAQ and other periodic Ham Radio information
as it gets posted. All the information posted to rec.radio.info can be
obtained through the UCSD list server via the "radio-info" mail list. To
subscribe, send an e-mail to
listserv@ucsd.edu
Similar to the e-mail server listed above, just send a single-line message
subscribe radio-info
If you need more information, the listserv program also accepts a "help"
command. Just keep it on a separate line in the message.

Option #6: Gopher

You can access gopher servers on TCP port 70 (gopher protocol) at the
following locations which carry the Ham Radio FAQ:
cc1.kuleuven.ac.be

jupiter.sun.csd.unb.ca
gopher.univ-lyon1.fr
ftp.win.tue.nl
gopher.win.tue.nl
For more information on gopher, see the comp.infosystems.gopher newsgroup.

Option #7: Wide Area Information Server (WAIS)

In addition to the other services mentioned above, rtfm.mit.edu offers a
WAIS server on TCP port 210. Use the "usenet" database to access the FAQ.

For more information on WAIS, see the comp.infosystems.wais newsgroup.

Table of Contents

Dates indicate last modification.

Part 1 - Introduction to the FAQ and Amateur Radio
** Table of Contents (6/93)
** Introduction to the FAQ (11/92)

* Telephone BBS's with Ham-related information (9/93)
* Callsign servers and geographical name servers (1/94)
* FTP access to FCC Part 97 and FCC Amateur Radio question pools (1/94)
* Lists of radio modifications and extensions (2/94)
** Can I send ARRL or W5YI electronic mail? (11/92)

** "Why doesn't the ARRL do...?" (11/92)
** What magazines are available for Ham Radio? (pre-4/92)
** How do I use the incoming and outgoing QSL bureau? (11/92)
** Are there any news groups for CAP? (11/92)
** What's the name of the QRP club that issues QRP numbers? (9/93)
** How do I become a 10-10 member? (9/93)
** How do I join MARS? (9/93)
** How do I join RACES? (pre-4/92)
** What organizations are available to help handicapped hams? (pre-4/92)
** I am looking for a specific ham, can anyone help me find him? (6/93)
** Can I post my neat new ham related program on rec.radio.amateur.misc?
(pre-4/92)
** Where can I get ham radio software for my computer? (9/93)
** Are there Dialup News services or BBSs for Amateur Radio? (4/92)
** Where can I find VE sessions in my local area? (9/93)
** Why isn't XXX available electronically? (1/94)
** I'd like to volunteer to help ham radio through electronic
information services like those mentioned in this FAQ list.
Where should I start? (2/94)

Part 3 - Amateur Radio Advanced and Technical Questions
** What are the different US amateur classes and what can each of them do?
(pre-4/92)
** What is the best way to learn Morse Code? (10/92)
** What is the standard for measuring Morse code speed? (pre-4/92)
** What is the standard phonetic alphabet? (new 9/93)
** I'm confused. What do all those abbreviations mean??? (6/93)
** What do all those "tones" mean? (pre-4/92)
** Where can I learn more about Amateur Radio if I live outside the US?
(9/93)
** How can I get a "reciprocal license" if I am a licensed ham from another
country or if I am a FCC licensed ham who wants to operate in another
country (on vacation)? (9/93)
** My apartment or housing complex does not allow outdoor antennas, now what
do I do? (9/93)
** I got TVI...HELP!!! (9/93)
** Did you know that you can get college credit for being a ham? (pre-4/92)
** On what frequencies do JPL and GSFC retransmit the shuttle audio?
(10/92)
** Can I take my HT on an airplane and operate it if I get the permission
of the captain? (4/92)
** How do I modify my current Amateur license? (9/93)
** I'm confused about XXX, should I ask the FCC? (9/93)
** Is there any information on antique radios? (pre-4/92)
** Where can I buy vacuum tubes? (9/93)
** What do I need to get started in packet radio? (9/93)
** What do I need to get started in satellite communications? (9/93)
** What is available to get started in ATV, SSTV and WEFAX? (9/93)
** What are these contests I sometimes hear, and how do I participate? (9/93)

--Asking Questions---

If you have questions about Amateur Radio (a.k.a. Ham Radio), please read the FAQ. If your question is not answered there, check if you have any other sources (i.e. Mosaic/WWW) before proceeding. If you still don't have an answer, post your question to the most appropriate rec.radio.amateur.* newsgroup. And be sure to mention where you have already looked for the answer so people won't mistakenly tell you to try them again.

Thank you for doing your part to conserve network bandwidth!

--Submitting changes for the FAQ----------

If you have comments or updates for the FAQ, send e-mail to
hamradio-faq@amdahl.com
This will send mail to all the people on the FAQ editorial review group.

--Call for FAQ Editors----------

As with any volunteer effort, new volunteers are often needed. We need a new editor to post the Ham Radio FAQ. Preferably this should be someone who has enthusiasm for Ham Radio, experience with UseNet, and the ability to work with the other editors. No single person can know all the various aspects of this diverse hobby so the editorial review group is intended to make a greater combination of experience.

The FAQ is currently posted with the AUTO-FAQ software, which is written in PERL. So it would be a plus for volunteers to post the FAQ to have PERL installed on their system and be able to use "cron" or "at" so that postings can go unattended.

Anyone who wants to make their contribution to the Net as a volunteer should contact hamradio-faq@amdahl.com.

3261. Re: I could use a Beverage

Newsgroup: rec.radio.amateur.misc

: oo7@astro.as.utexas.edu

To date, there have been four responses to this question, and I agree with everything they have said, but none has addressed the major factor that makes a Beverage good for receiving but not for transmitting.

For transmitting, you want the maximum signal strength. For receiving, you want the maximum SIGNAL TO NOISE ratio. At high frequencies (<30 Mhz) modern receivers provide noise figures well below the level of natural QRN, so you can always amplify received signals as much as necessary to provide audible signals, no matter how weak they are, if the signal to noise ratio is adequate. Beverage antennas deliver low signal strength, but even lower noise, so are superior for receiving.

They DO follow the law of reciprocity. They deliver low signal strength in both transmitting and receiving; you don't care in the latter case, but do in the former.

Laurent PELLISSIER (lpelliss@ensm-ales.fr) wrote:
: Here in France the GSM system is very very inexpensive. In fact
: some store sell one to you for FREE (but you have to subscribe for one
: year to a telephone company). Also they are two operators of the GSM in
: France (a third one is expected for soon!) so the competition between
: them is very hard and the price decrease a lot. For example in the
: beginning of the GSM (3 years ago) a such device cost 6000 FF (1 US$
: for 6 FF) now you can find some at less than 1000 FF. It's totally
: crazy (especially for scanner listenner). Moreover the GSM system is
: scrambled so there is no {easy} way to listen them.
: So I am very surprised to learn that in the US the digital
: cellphones are so expensive.

Hi,
AFAIK, (maybe this has been discussed already) UK (and France) has the cheapest GSM service available (phones and network). As an example in Hong Kong, Motorola 7200 are around HK$ 8800 (1 US$ = 7.73 HK$), Nokia 2110 are around HK$10k. The same phones cost about 150 - 250 GBP (UK) subject to a one year contract, add about 250 to 300 for no contract (usually referred to as ESN free, as the service provider holds it). Most of the world uses GSM, USA, Russia and Japan excepted. Great shame.

There are many major operators (service providers) in the UK, four digital, two analogue. (2 GSM + 2 DSC [like GSM but at 1.8GHz]).

regards
Chun

Anyone out there in Cyberspace have "mod" info on the new FT-900 from Yaesu?
Just got one and it isn't as obvious as my FT-1000, 757, or the TS-50 it is
replacing. Poured over the schematics looked at cntl boards, and nada. I'm told
it is probably in the firmware now to push there buttons while turning on.

Fooled it by holding the "SEND" line high and it would transmit on MARS freq's.
But the FM operation was not correct after that.

Looked at the FT-890 info, but it isn't the same radio...those instructions
don't work.

HELP!

3269. Are ordinary alkalines rechargeable?

Newsgroup: rec.radio.amateur.misc
Date: 1994-08-28 17:31:30 UTC
From: dmm@bud.indirect.com
Message-ID: <33qhli$7a7@herald.indirect.com>
Source record: 261022

I was in a Radio Shack the other day and I overheard a salesperson selling someone a battery charger, and he was clearly claiming that it could recharge alkaline batteries. He even sold them ordinary RS alkalines, so we're not talking about the newfangled "rechargeable alkalines" which can be recharged something like 25 times.

On the air last night someone was complaining about how some RS staffers don't know what they're talking about and I chimed in and related this story.

I was then summarily "corrected" by someone else on the air who claimed that RS did indeed have a special charger that recharged ordinary alkalines. Not wanting to start an argument, I signed off and went to check my new RS catalog.

I found no charger that claimed to charge ordinary alkalines. Furthermore, the catalog discussed the various battery types and the only type listed with the word "rechargeable" were NiCd's.

I'm aware that in the 70's, there were lots of chargers out there that claimed to be able to charge ordinary batteries, including carbon. I think some gov't agency finally cracked down on that deceptive advertising, and that's why nowadays only batteries that are genuinely rechargeable are labeled as such.

I tried to reach the person who "corrected" me but he had signed off, so everyone else in that QSO probably thinks I'm an idiot now.

ARE ordinary alkalines rechargeable?
Doug

3270. Re: Why Some people hate Wayne Green

Newsgroup: rec.radio.amateur.misc
Date: 1994-08-28 18:26:50 UTC
From: greg@netcom.com
Message-ID: <gregCv9CKq.7JK@netcom.com>
Source record: 261024

In article <33dg3p$8hv@search01.news.aol.com> wwhitby@aol.com (Wwhitby) writes:
>I don't hate anyone, let alone Wayne.
>
>What I dislike is: He rambles about the problems our country has, but he
>doesn't seem to actually put forth any physical effort to correct them. I
>work with teenagers, and it is a sore spot for people to talk about how
>bad this world is, but not actually do anything.

You don't consider publishing a monthly journal on the subject of
Amateur Radio, which is one of the better ways for aspiring techies
to hone their skills as being 'physical effort?'

Hmmm.

Perhaps you're suffering from the old tunnel vision of 'what *I* do
is necessary and productive, but what everyone else does is contributing
to the world's woes' syndrome.

Guess it ain't just those teenagers what think the world revolves around
them and their problems, what?

Greg

3271. Re: You have been a ham too long...

Newsgroup: rec.radio.amateur.misc
Date: 1994-08-28 18:36:08 UTC
From: martinja@aspen.uml.edu
Message-ID: <1994Aug28.133608.1@aspen.uml.edu>
Source record: 261023

In article <9408281018591.DLITE.davesparks@delphi.com>, davesparks@delphi.com (Dave Sparks) writes:

>> Oh well, can't be a VE anymore... :(

> Just out of curiosity, why not? Is that considered a "conflict of
> interest", or something?

Well Dave, paragraph 97.515(b) says that anyone who owns a significant interest in [not me], or is an employee of [I seem to fit in here], any company or other entity that is engaged in the manufacture or distribution of equipment used in connection with amateur station transmissions [etc.]... is ineligible to be an administering VE.

Now I know you are a good ham and have a current copy of Part 97 in your shack. Right Dave? Dave? Dave!

Bob Levine <levine@mc.com> writes:

>He waited 17 years to take the test and now complains that the
>government is taking 14 weeks to give him his FREE license.

Exactly how many newborn babies are capable of passing an amateur license exam?

More to the point, exactly how does the fact that this license is issued at
no charge (it's really paid for with tax money) justify rotten service?

3274. Radio Amateurs on USENET List Aug 1994 Part 1 of 6

Newsgroup: rec.radio.amateur.misc
Date: 1994-08-28 20:58:14 UTC

```
Archive-name: radio/ham-radio/hams-on-usenet/part1
Last-modified: $Date: 94/8/28 14 58$
Version: $Revision: 1.03 $

I would be pleased to take any e-mail updates to this list, preferably at
hams-on-usenet@ve6mgs.ampr.ab.ca. Only entries less than 12 months old are
posted here, but the ftp and email servers contain entries that are older. I
have split this list into six parts. This
First part contains primarily European calls with US call district 0.

The index of parts:
Part 1 contains 4x1bq through n0zyc
Part 2 contains nv1a through n2zxe
Part 3 contains wn3a through kd4zzj
Part 4 contains kj5aa through ab6zz
Part 5 contains aa7a through wa9zxm
Part 6 contains oa4hv through zs6tw

Ciao, 73 de VE6MGS/Mark -sk-

# Network address to name or call letters lookup table maintained by
# Mark Salyzyn VE6MGS mark@ve6mgs.ampr.org
# Note, Dave Horsfall is replacing Mark Salyzyn on August 28th 1994.
#
# Please send corrections/deletions/additions to hamlist@esi.com.au
# (Dave Horsfall VK2KFU). Many additions and updates are generated by collecting
# postings to the rec.radio.amateur.* hierarchy, so keep that in mind when
# requesting additions.
#
# Australian Amateur Radio Operators may prefer to mail their updates to Dean
# Davidson (VK2ZID) <ddavidso@metz.une.edu.au>.
#
# Comentarios, sugerencias o contribuciones en espa~ol, por favor hacerlas
# llegar a Rodrigo E. Rodriguez (CE6NUG) <rrodrigu@loa.disca.utfsm.cl>
#
# Any person interested in handling regional versions of the list are invited
# to drop me a note, I am particularily interested in representatives of
# non-english speaking regions so as to increase the accessibility of the list.

```

thus thank Fred Lloyd <flloyd@qrz.com> for his efforts.
#
email `grep' server reqnet@ve6mgs.ampr.ab.ca in the body of the message put
a `lookup string ...'. email response limited to 10K. if you want to specify
a return address, add optional `return user@host.domain'. For example:
Subject: Could be anything (sure!)
return wabbit@it.was.a.tewibble.storm.edu
lookup ka2nrc ve6tcp nm1d elmer
#
Last update August 24 1994
#
This document may be distributed freely, as long as there is no financial
gain. I do not condone this list being used for generating junk mail or
other annoyances as this is not the purpose of the list. If you are in this
list and wish to keep your entry hidden, or that the name I have here be
changed (My middle name is Gregory and I am **** proud of it :-), I would
oblige.
#
Entries have this format (-> denotes separated by at least one tab):
Address (Name) -> Call -> Date
#
Address
Network address popularily used by individuals on the network. Although
the address that many news posters add may be incorrect, personal
e-mail contacts or updates are always placed first in the list of
duplicate calls. Removal of entries is by complaint only, so some
(mainly .EDU) may be invalid over time. For fidonet addresses I have
used the form #:#/#.#@<Fido>, try <name>@p#.f#.n#.z#.FidoNet.Org
(note address numbers in reverse order).
Name Name of the individual.
Call Call letters of the individual. Old and alternate calls '/' separated.
Date Last update YY-M[-D] International format.
A trailing * denotes not searched in call book for verification yet, @
means not found in call book (1987, 1992 CAN or 1993 US). ? after means
recheck may be required (eg. Call does not match name).
#
This list has a life of it's own, so references to *my* list will be ignored.
